[77253] Another function of VGAM2257 is therefore inhibition of Protocadherin 9 (PCDH9, Accession XM_096054). Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH9. Serine/threonine Kinase 10 (STK10, Accession NM_005990) is another VGAM2257 host target gene. STK10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK10 BINDING SITE, designated SEQ ID:12614, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77254] Another function of VGAM2257 is therefore inhibition of Serine/threonine Kinase 10 (STK10, Accession NM_005990), a gene which can act on substrates such as myelin basic protein and histone iia on serine and threonine residues. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK10. The function of

STK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.TEA Domain Family Member 3 (TEAD3, Accession NM_003214) is another VGAM2257 host target gene. TEAD3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TEAD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEAD3 BINDING SITE, designated SEQ ID:9210, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77255] Another function of VGAM2257 is therefore inhibition of TEA Domain Family Member 3 (TEAD3, Accession NM_003214), a gene which binds to multiple functional elements of the human chorionic somatomammotropin-b gene enhancer. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEAD3. The function of TEAD3 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM299.Wolf-Hirschhorn Syndrome Candidate 1-like 1 (WHSC1L1, Accession NM_023034) is another VGAM2257 host target gene. WHSC1L1 BINDING SITE1 and WHSC1L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1L1 BINDING SITE1 and WHSC1L1 BINDING SITE2, designated SEQ ID:23318 and SEQ ID:19411 respectively, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77256] Another function of VGAM2257 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1-like 1 (WHSC1L1, Accession NM_023034), a gene which restores repair of base-base and single- nucleotide insertion-deletion mismatches, and increases the proficiency to process heteroduplexes with insertion-deletion mismatches. Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1L1. The function of WHSC1L1 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM475.LOC203871 (Accession XM_115029) is another VGAM2257 host target gene. LOC203871 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203871 BINDING SITE, designated SEQ ID:43080, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77257] Another function of VGAM2257 is therefore inhibition of LOC203871 (Accession XM_115029). Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203871. LOC221250 (Accession XM_166301) is another VGAM2257 host target gene. LOC221250 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221250 BINDING SITE, designated SEQ ID:44120, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77258] Another function of VGAM2257 is therefore inhibition of LOC221250 (Accession XM_166301). Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221250. LOC253805 (Accession XM_172854) is another VGAM2257 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46135, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77259] Another function of VGAM2257 is therefore inhibition of LOC253805 (Accession XM_172854). Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. LOC91145 (Accession XM_036454) is another VGAM2257 host target gene. LOC91145 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91145 BINDING SITE, designated SEQ ID:32451, to the nucleotide sequence of VGAM2257 RNA, herein designated VGAM RNA, also designated SEQ ID:4968.

[77260] Another function of VGAM2257 is therefore inhibition of LOC91145 (Accession XM_036454). Accordingly, utilities of VGAM2257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2258 (VGAM2258) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77261] VGAM2258 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2258 was detected is described hereinabove with reference to Figs. 1-8.

[77262] VGAM2258 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Oat Chlorotic Stunt Virus. VGAM2258 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77263] VGAM2258 gene encodes a VGAM2258 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2258 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2258 precursor RNA is designated SEQ ID:2244, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2244 is located at position 1727 relative to the genome of Oat Chlorotic Stunt Virus.

[77264] VGAM2258 precursor RNA folds onto itself, forming VGAM2258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[77265] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2258 folded precursor RNA into VGAM2258 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2258 RNA is designated SEQ ID:4969, and is provided hereinbelow with reference to the sequence listing part.

[77266] VGAM2258 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2258 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77267] VGAM2258 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2258 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2258 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2258 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77268] The complementary binding of VGAM2258 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2258 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2258 host target RNA into VGAM2258 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77269] It is appreciated that VGAM2258 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2258 host target genes. The mRNA of each one of this plurality of VGAM2258 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2258 RNA, herein designated VGAM RNA, and which when bound by VGAM2258 RNA causes inhibition of translation of respective one or more VGAM2258 host target proteins.

[77270] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2258 gene, herein designated VGAM GENE, on one or more VGAM2258 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77271] It is yet further appreciated that a function of VGAM2258 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of viral infection by Oat Chlorotic Stunt Virus. Specific functions, and accordingly utilities, of VGAM2258 correlate with, and may be deduced from, the identity of the host target genes which VGAM2258 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77272] Nucleotide sequences of the VGAM2258 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2258 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2258 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2258 are further described hereinbelow with reference to Table 1.

[77273] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2258 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2258 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77274] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2258 gene, herein designated VGAM is inhibition of expression of VGAM2258 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2258 correlate with, and may be deduced from, the identity of the target genes which VGAM2258 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77275] Ets Variant Gene 5 (ets-related molecule) (ETV5, Accession NM_004454) is a VGAM2258 host target gene. ETV5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ETV5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ETV5 BINDING SITE, designated SEQ ID:10747, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77276] A function of VGAM2258 is therefore inhibition of Ets Variant Gene 5 (ets-related molecule) (ETV5, Accession NM_004454), a gene which DNA binding protein of the Ets oncoprotein family. Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETV5. The function of ETV5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1171.Hepatocyte Nuclear Factor 4, Gamma (HNF4G, Accession NM_004133) is another VGAM2258 host target gene. HNF4G BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HNF4G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNF4G BINDING SITE, designated SEQ ID:10346, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ

ID:4969.

[77277] Another function of VGAM2258 is therefore inhibition of Hepatocyte Nuclear Factor 4, Gamma (HNF4G, Accession NM_004133), a gene which may be involved in differential regulation of HNF4-dependent genes. Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNF4G. The function of HNF4G has been established by previous studies. By screening kidney cDNA libraries with a probe based on frog Hnf4-beta, Drewes et al. (1996) isolated cDNAs encoding HNF4G and variants of HNF4A. Sequence analysis predicted that the 774-amino acid HNF4G protein has a relatively long N-terminal domain compared with that of HNF4A, and nearly identical DNA-binding and ligand-binding domains. The C-terminal F domain of HNF4G is 37% identical to that of HNF4A. Northern blot analysis revealed weak expression of 5.5- and 4.1-kb HNF4G transcripts in pancreas, kidney, small intestine, and testis, with no expression detected in liver or other tissues tested. In contrast, expression of HNF4A was detected in liver as well as in all tissues expressing HNF4G. Cells expressing HNF4G had significantly less transactivation potential compared with those ex-

pressing HNF4A. Drewes et al. (1996) concluded that differential transcriptional regulation of HNF4-dependent genes may be due to differential expression of HNF4 proteins. By PCR analysis of genomic DNA from hybrid cell lines, Drewes et al. (1996) mapped the HNF4G gene to chromosome 8. Taraviras et al. (2000) mapped the mouse Hnf4g gene to chromosome 3A.

[77278] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[77279] Drewes, T.; Senkel, S.; Holewa, B.; Ryffel, G. U. : Human hepatocyte nuclear factor 4 isoforms are encoded by distinct and differentially expressed genes. Molec. Cell. Biol. 16: 925-931, 1996. ; and

[77280] Taraviras, S.; Mantamadiotis, T.; Dong-Si, T.; Mincheva, A.; Lichter, P.; Drewes, T.; Ryffel, G. U.; Monaghan, A. P.; Schutz, G. : Primary structure, chromosomal mapping, expression and tra.

[77281] Further studies establishing the function and utilities of HNF4G are found in John Hopkins OMIM database record ID 605966, and in sited publications numbered 6811-6812 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM_003024) is another VGAM2258 host target gene. ITSN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITSN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITSN1 BINDING SITE, designated SEQ ID:8955, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77282] Another function of VGAM2258 is therefore inhibition of Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM_003024), a gene which may be involved in endocytosis and synaptic vesicle recycling. Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITSN1. The function of ITSN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1233.Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326) is another VGAM2258 host target gene. TNFSF4 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF4 BINDING SITE, designated SEQ ID:9332, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77283] Another function of VGAM2258 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326), a gene which co-stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463.Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152) is another VGAM2258 host target gene. C20orf12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by C20orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf12 BINDING SITE, designated SEQ ID:19958, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77284] Another function of VGAM2258 is therefore inhibition of Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf12. Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943) is another VGAM2258 host target gene. CLIC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLIC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC4 BINDING SITE, designated SEQ ID:15129, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77285] Another function of VGAM2258 is therefore inhibition of

Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC4. DKFZp434A171 (Accession XM_047716) is another VGAM2258 host target gene. DKFZp434A171 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434A171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A171 BINDING SITE, designated SEQ ID:35037, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77286] Another function of VGAM2258 is therefore inhibition of DKFZp434A171 (Accession XM_047716). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A171. IPLA2(GAMMA) (Accession XM_027224) is another VGAM2258 host target gene. IPLA2(GAMMA) BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IPLA2(GAMMA), corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IPLA2(GAMMA) BINDING SITE, designated SEQ ID:30445, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77287] Another function of VGAM2258 is therefore inhibition of IPLA2(GAMMA) (Accession XM_027224). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPLA2(GAMMA). KIAA0171 (Accession NM_014666) is another VGAM2258 host target gene. KIAA0171 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0171 BINDING SITE, designated SEQ ID:16122, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77288] Another function of VGAM2258 is therefore inhibition of KIAA0171 (Accession NM_014666). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0171. KIAA1879 (Accession XM_056635) is another VGAM2258 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36414, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77289] Another function of VGAM2258 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117) is another VGAM2258 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ

ID:21195, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77290] Another function of VGAM2258 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4. LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697) is another VGAM2258 host target gene. LANCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LANCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL2 BINDING SITE, designated SEQ ID:20777, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77291] Another function of VGAM2258 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697). Accordingly, utilities of VGAM2258 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with LANCL2. LEC3 (Accession NM_015236) is another VGAM2258 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17569, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77292] Another function of VGAM2258 is therefore inhibition of LEC3 (Accession NM_015236). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. MGC21688 (Accession NM_144635) is another VGAM2258 host target gene. MGC21688 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC21688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21688 BINDING SITE, designated SEQ ID:29454, to the nucleotide se-

quence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77293] Another function of VGAM2258 is therefore inhibition of MGC21688 (Accession NM_144635). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21688. MGC5566 (Accession NM_024049) is another VGAM2258 host target gene. MGC5566 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5566 BINDING SITE, designated SEQ ID:23486, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77294] Another function of VGAM2258 is therefore inhibition of MGC5566 (Accession NM_024049). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5566. Mitochondrial Ribosomal Protein S21 (MRPS21, Accession NM_018997) is another VGAM2258 host target gene. MRPS21 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by MRPS21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS21 BINDING SITE, designated SEQ ID:21070, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77295] Another function of VGAM2258 is therefore inhibition of Mitochondrial Ribosomal Protein S21 (MRPS21, Accession NM_018997). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS21. Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540) is another VGAM2258 host target gene. NCOA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA2 BINDING SITE, designated SEQ ID:13295, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77296] Another function of VGAM2258 is therefore inhibition of Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA2. RP4-622L5 (Accession NM_019118) is another VGAM2258 host target gene. RP4-622L5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RP4-622L5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP4-622L5 BINDING SITE, designated SEQ ID:21201, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77297] Another function of VGAM2258 is therefore inhibition of RP4-622L5 (Accession NM_019118). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP4-622L5. TACTILE (Accession NM_005816) is another VGAM2258 host target gene. TACTILE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACTILE, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACTILE BINDING SITE, designated SEQ ID:12412, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77298] Another function of VGAM2258 is therefore inhibition of TACTILE (Accession NM_005816). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACTILE. LOC112840 (Accession NM_080666) is another VGAM2258 host target gene. LOC112840 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112840 BINDING SITE, designated SEQ ID:27957, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77299] Another function of VGAM2258 is therefore inhibition of LOC112840 (Accession NM_080666). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC112840. LOC127702 (Accession XM_060619) is another VGAM2258 host target gene. LOC127702 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:37181, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77300] Another function of VGAM2258 is therefore inhibition of LOC127702 (Accession XM_060619). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127702. LOC146287 (Accession XM_096967) is another VGAM2258 host target gene. LOC146287 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146287 BINDING SITE, designated SEQ ID:40689, to

the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77301] Another function of VGAM2258 is therefore inhibition of LOC146287 (Accession XM_096967). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146287. LOC150933 (Accession XM_097971) is another VGAM2258 host target gene. LOC150933 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150933 BINDING SITE, designated SEQ ID:41271, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77302] Another function of VGAM2258 is therefore inhibition of LOC150933 (Accession XM_097971). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150933. LOC255374 (Accession XM_171171) is another VGAM2258 host target gene. LOC255374 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC255374, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255374 BINDING SITE, designated SEQ ID:45955, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77303] Another function of VGAM2258 is therefore inhibition of LOC255374 (Accession XM_171171). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255374. LOC90906 (Accession XM_034809) is another VGAM2258 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32150, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77304] Another function of VGAM2258 is therefore inhibition of LOC90906 (Accession XM_034809). Accordingly, utilities

of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. LOC92080 (Accession XM_042704) is another VGAM2258 host target gene. LOC92080 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92080 BINDING SITE, designated SEQ ID:33758, to the nucleotide sequence of VGAM2258 RNA, herein designated VGAM RNA, also designated SEQ ID:4969.

[77305] Another function of VGAM2258 is therefore inhibition of LOC92080 (Accession XM_042704). Accordingly, utilities of VGAM2258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2259 (VGAM2259) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77306] VGAM2259 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2259 was detected is described hereinabove with reference to Figs. 1-8.

[77307] VGAM2259 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2259 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77308] VGAM2259 gene encodes a VGAM2259 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2259 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2259 precursor RNA is designated SEQ ID:2245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2245 is located at position 30401 relative to the genome of Alcelaphine Herpesvirus 1.

[77309] VGAM2259 precursor RNA folds onto itself, forming VGAM2259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77310] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2259 folded precursor RNA into VGAM2259 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2259 RNA is designated SEQ ID:4970, and is provided hereinbelow with reference to the sequence listing part.

[77311] VGAM2259 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2259 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[77312] VGAM2259 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2259 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2259 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77313] The complementary binding of VGAM2259 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2259 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2259 host target RNA into VGAM2259 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77314] It is appreciated that VGAM2259 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2259 host target genes. The mRNA of each one of this plurality of VGAM2259 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2259 RNA, herein designated VGAM RNA, and which when bound by VGAM2259 RNA causes inhibition of translation of respective one or more VGAM2259 host target proteins.

[77315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2259 gene, herein designated VGAM GENE, on one or more VGAM2259 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77316] It is yet further appreciated that a function of VGAM2259 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2259 correlate with, and may be deduced from, the identity of the host target genes which VGAM2259 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77317] Nucleotide sequences of the VGAM2259 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2259 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2259 are further described hereinbelow with reference to Table 1.

[77318] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2259 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2259 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77319] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2259 gene, herein designated VGAM is inhibition of expression of VGAM2259 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2259 correlate with, and may be deduced from, the identity of the target genes which VGAM2259 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77320] ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM_001618) is a VGAM2259

host target gene. ADPRT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADPRT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADPRT BINDING SITE, designated SEQ ID:7326, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77321] A function of VGAM2259 is therefore inhibition of ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM_001618), a gene which catalyzes addition of mono-ADP-ribose to arginine residues of proteins, inhibits Pol II transcription. Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADPRT. The function of ADPRT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM506.Diptheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 1 (S. cerevisiae) (DPH2L1, Accession NM_001383) is another VGAM2259 host target gene. DPH2L1 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by DPH2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPH2L1 BINDING SITE, designated SEQ ID:7055, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77322] Another function of VGAM2259 is therefore inhibition of Diptheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 1 (S. cerevisiae) (DPH2L1, Accession NM_001383), a gene which may be involved in regulating global protein synthesis; has similarity to S. cerevisiae Dph2p. Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPH2L1. The function of DPH2L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM608.Guanylate Binding Protein 1, Interferon-inducible, 67kDa (GBP1, Accession NM_002053) is another VGAM2259 host target gene. GBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by GBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBP1 BINDING SITE, designated SEQ ID:7811, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77323] Another function of VGAM2259 is therefore inhibition of Guanylate Binding Protein 1, Interferon-inducible, 67kDa (GBP1, Accession NM_002053), a gene which specifically binds guanylate nucleotides (GMP, GDP and GTP). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBP1. The function of GBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46.Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is another VGAM2259 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:12844, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77324] Another function of VGAM2259 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.Phosphodiesterase 4B, CAMP-specific (phosphodiesterase E4 dunce homolog, Drosophila) (PDE4B, Accession NM_002600) is another VGAM2259 host target gene. PDE4B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4B BINDING SITE, des-

ignated SEQ ID:8464, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77325] Another function of VGAM2259 is therefore inhibition of Phosphodiesterase 4B, CAMP-specific (phosphodiesterase E4 dunce homolog, Drosophila) (PDE4B, Accession NM_002600), a gene which may be involved in mediating central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti-inflammatory agents. Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4B. The function of PDE4B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.PRO0149 (Accession NM_014117) is another VGAM2259 host target gene. PRO0149 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0149 BINDING SITE, designated SEQ ID:15370, to the nucleotide

sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77326] Another function of VGAM2259 is therefore inhibition of PRO0149 (Accession NM_014117). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0149. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM2259 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30688, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77327] Another function of VGAM2259 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. LOC127428 (Accession XM_059144) is another

VGAM2259 host target gene. LOC127428 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127428 BINDING SITE, designated SEQ ID:36899, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77328] Another function of VGAM2259 is therefore inhibition of LOC127428 (Accession XM_059144). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127428. LOC149175 (Accession XM_086445) is another VGAM2259 host target gene. LOC149175 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149175 BINDING SITE, designated SEQ ID:38659, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77329] Another function of VGAM2259 is therefore inhibition of LOC149175 (Accession XM_086445). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149175. LOC158318 (Accession XM_098925) is another VGAM2259 host target gene. LOC158318 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158318 BINDING SITE, designated SEQ ID:41956, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77330] Another function of VGAM2259 is therefore inhibition of LOC158318 (Accession XM_098925). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158318. LOC158450 (Accession XM_088580) is another VGAM2259 host target gene. LOC158450 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158450, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158450 BINDING SITE, designated SEQ ID:39845, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77331] Another function of VGAM2259 is therefore inhibition of LOC158450 (Accession XM_088580). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158450. LOC158504 (Accession XM_088591) is another VGAM2259 host target gene. LOC158504 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158504 BINDING SITE, designated SEQ ID:39856, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77332] Another function of VGAM2259 is therefore inhibition of LOC158504 (Accession XM_088591). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158504. LOC51170 (Accession NM_016245) is another VGAM2259 host target gene. LOC51170 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51170 BINDING SITE, designated SEQ ID:18364, to the nucleotide sequence of VGAM2259 RNA, herein designated VGAM RNA, also designated SEQ ID:4970.

[77333] Another function of VGAM2259 is therefore inhibition of LOC51170 (Accession NM_016245). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51170. LOC90249 (Accession XM_030300) is another VGAM2259 host target gene. LOC90249 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90249 BINDING SITE, designated SEQ ID:31015, to the nucleotide sequence of VGAM2259 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4970.

[77334] Another function of VGAM2259 is therefore inhibition of LOC90249 (Accession XM_030300). Accordingly, utilities of VGAM2259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2260 (VGAM2260) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77335] VGAM2260 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2260 was detected is described hereinabove with reference to Figs. 1-8.

[77336] VGAM2260 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77337] VGAM2260 gene encodes a VGAM2260 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2260 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2260 precursor RNA is designated SEQ ID:2246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2246 is located at position 26713 relative to the genome of Alcelaphine Herpesvirus 1.

[77338] VGAM2260 precursor RNA folds onto itself, forming VGAM2260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77339] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2260 folded precursor RNA into VGAM2260 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM2260 RNA is designated SEQ ID:4971, and is provided hereinbelow with reference to the sequence listing part.

[77340] VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2260 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77341] VGAM2260 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2260 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2260 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77342] The complementary binding of VGAM2260 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2260 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2260 host target RNA into VGAM2260 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77343] It is appreciated that VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2260 host target genes. The mRNA of

each one of this plurality of VGAM2260 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2260 RNA, herein designated VGAM RNA, and which when bound by VGAM2260 RNA causes inhibition of translation of respective one or more VGAM2260 host target proteins.

[77344] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2260 gene, herein designated VGAM GENE, on one or more VGAM2260 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[77345] It is yet further appreciated that a function of VGAM2260 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2260 correlate with, and may be deduced from, the identity of the host target genes which VGAM2260 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77346] Nucleotide sequences of the VGAM2260 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2260 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2260 are further described hereinbelow with reference to Table 1.

[77347] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2260 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2260 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77348] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2260 gene, herein designated VGAM is inhibition of expression of VGAM2260 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2260 correlate with, and may be deduced from, the identity of the target genes which VGAM2260 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77349] Secretogranin III (SCG3, Accession NM_013243) is a VGAM2260 host target gene. SCG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCG3 BINDING SITE, designated SEQ ID:14902, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77350] A function of VGAM2260 is therefore inhibition of Secretogranin III (SCG3, Accession NM_013243). Accordingly, utilities of VGAM2260 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SCG3. Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312) is another VGAM2260 host target gene. C11orf23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf23 BINDING SITE, designated SEQ ID:20302, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77351] Another function of VGAM2260 is therefore inhibition of Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312). Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf23. COAS3 (Accession NM_139020) is another VGAM2260 host target gene. COAS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of COAS3 BINDING SITE, designated SEQ ID:29119, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77352] Another function of VGAM2260 is therefore inhibition of COAS3 (Accession NM_139020). Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COAS3. FLJ12076 (Accession NM_025187) is another VGAM2260 host target gene. FLJ12076 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12076 BINDING SITE, designated SEQ ID:24822, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77353] Another function of VGAM2260 is therefore inhibition of FLJ12076 (Accession NM_025187). Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12076. KIAA1550 (Accession XM_039393) is another

VGAM2260 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33069, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77354] Another function of VGAM2260 is therefore inhibition of KIAA1550 (Accession XM_039393). Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. NRBF-2 (Accession NM_030759) is another VGAM2260 host target gene. NRBF-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRBF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRBF-2 BINDING SITE, designated SEQ ID:25043, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77355] Another function of VGAM2260 is therefore inhibition of NRBF-2 (Accession NM_030759). Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRBF-2. SE57-1 (Accession NM_025214) is another VGAM2260 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24887, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77356] Another function of VGAM2260 is therefore inhibition of SE57-1 (Accession NM_025214). Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1. WWP1 (Accession XM_087357) is another VGAM2260 host target gene. WWP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWP1 BINDING SITE, designated SEQ ID:39190, to the nucleotide sequence of VGAM2260 RNA, herein designated VGAM RNA, also designated SEQ ID:4971.

[77357] Another function of VGAM2260 is therefore inhibition of WWP1 (Accession XM_087357). Accordingly, utilities of VGAM2260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2261 (VGAM2261) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77358] VGAM2261 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2261 was detected is described hereinabove with reference to Figs. 1-8.

[77359] VGAM2261 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[77360] VGAM2261 gene encodes a VGAM2261 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2261 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2261 precursor RNA is designated SEQ ID:2247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2247 is located at position 24763 relative to the genome of Alcelaphine Herpesvirus 1.

[77361] VGAM2261 precursor RNA folds onto itself, forming VGAM2261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77362] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2261 folded precursor RNA into VGAM2261 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2261 RNA is designated SEQ ID:4972, and is provided hereinbelow with reference to the sequence listing part.

[77363] VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2261 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77364] VGAM2261 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2261 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2261 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77365] The complementary binding of VGAM2261 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2261 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2261 host target RNA into VGAM2261 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77366] It is appreciated that VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2261 host target genes. The mRNA of each one of this plurality of VGAM2261 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2261 RNA, herein designated VGAM RNA, and which when bound by VGAM2261 RNA causes inhibition of translation of respective one or more VGAM2261 host target proteins.

[77367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2261 gene, herein designated VGAM GENE, on one or more VGAM2261 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77368] It is yet further appreciated that a function of VGAM2261 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2261 correlate with, and may be deduced from, the identity of the host target genes which VGAM2261 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77369] Nucleotide sequences of the VGAM2261 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2261 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2261 are further described hereinbelow with reference to Table 1.

[77370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2261 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2261 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77371] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2261 gene, herein designated VGAM is inhibition of expression of VGAM2261 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2261 correlate with, and may be deduced from, the identity of the target genes which VGAM2261 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77372] ATPase, Ca++ Transporting, Ubiquitous (ATP2A3, Accession NM_005173) is a VGAM2261 host target gene. ATP2A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP2A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A3 BINDING SITE, designated SEQ ID:11672, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ

ID:4972.

[77373] A function of VGAM2261 is therefore inhibition of ATPase, Ca++ Transporting, Ubiquitous (ATP2A3, Accession NM_005173). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A3. Gamma-aminobutyric Acid (GABA) A Receptor, Pi (GABRP, Accession NM_014211) is another VGAM2261 host target gene. GABRP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRP BINDING SITE, designated SEQ ID:15478, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77374] Another function of VGAM2261 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Pi (GABRP, Accession NM_014211), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM2261 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with GABRP. The function of GABRP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM795.N-deacetylase/N-sulfotransferase (heparan glucosaminyl) 1 (NDST1, Accession NM_001543) is another VGAM2261 host target gene. NDST1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NDST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDST1 BINDING SITE, designated SEQ ID:7270, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77375] Another function of VGAM2261 is therefore inhibition of N-deacetylase/N-sulfotransferase (heparan glucosaminyl) 1 (NDST1, Accession NM_001543), a gene which catalyses the n-sulfation and n-deacetylation of glucosamine of the glycosaminoglycan in heparan sulfate. Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with NDST1. The function of NDST1 has been established by previous studies. Dixon et al. (1995) cloned a human heparan sulfate N-deacetylase/N-sulfotransferase cDNA from a placental library using a cosmid from the Treacher Collins syndrome (OMIM Ref. No. 154500) candidate region, 5q32-q33.1. They detected 2 different mRNAs, which varied in the length of the 3-prime UTR but encoded the same protein. The sequence predicted an 882-amino acid protein which is 98% identical to the previously reported rat gene (Hashimoto et al., 1995). The Treacher Collins Syndrome Collaborative Group (1996) stated that the most 5-prime exon of HSST lies approximately 150 kb distal to 'TREACLE,' the gene responsible for Treacher Collins syndrome. Gladwin et al. (1996) elucidated the genomic organization of the HSST gene with identification of 14 exons which were tested for Treacher-Collins-specific mutations. Mutations within the coding sequence and adjacent splice junctions of HSST were excluded from a causative role in the pathogenesis of Treacher Collins syndrome.

[77376] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[77377] Dixon, J.; Loftus, S. K.; Gladwin, A. J.; Scambler, P. J.; Wasmuth, J. J.; Dixon, M. J. : Cloning of the human heparan sulfate-N-deacetylase/N-sulfotransferase gene from the Treacher Collins syndrome candidate region at 5q32-q33.1. Genomics 26: 239-244, 1995. ; and

[77378] Gladwin, A. J.; Dixon, J.; Loftus, S. K.; Wasmuth, J. J.; Dixon, M. J. : Genomic organization of the human heparan sulfate-N-deacetylase/N-sulfotransferase gene: exclusion from a causat.

[77379] Further studies establishing the function and utilities of NDST1 are found in John Hopkins OMIM database record ID 600853, and in sited publications numbered 10062-1006 and 3538 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Beta Isoform (PPP2R2B, Accession NM_004576) is another VGAM2261 host target gene. PPP2R2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP2R2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R2B BINDING SITE, designated SEQ

ID:10923, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77380] Another function of VGAM2261 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Beta Isoform (PPP2R2B, Accession NM_004576). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R2B. Ryanodine Receptor 3 (RYR3, Accession NM_001036) is another VGAM2261 host target gene. RYR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RYR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RYR3 BINDING SITE, designated SEQ ID:6700, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77381] Another function of VGAM2261 is therefore inhibition of Ryanodine Receptor 3 (RYR3, Accession NM_001036), a gene which is involved in communication between transverse-tubules and sarcoplasmic reticulum. Accordingly,

utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RYR3. The function of RYR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2014.Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na+/H+, amiloride sensitive) (SLC9A1, Accession XM_046881) is another VGAM2261 host target gene. SLC9A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC9A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A1 BINDING SITE, designated SEQ ID:34857, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77382] Another function of VGAM2261 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na+/H+, amiloride sensitive) (SLC9A1, Accession XM_046881), a gene which is involved in ph regulation to eliminate acids generated by active

metabolism or to counter adverse environmental conditions. Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A1. The function of SLC9A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.TYRO3 Protein Tyrosine Kinase (TYRO3, Accession NM_006293) is another VGAM2261 host target gene. TYRO3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TYRO3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TYRO3 BINDING SITE, designated SEQ ID:12984, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77383] Another function of VGAM2261 is therefore inhibition of TYRO3 Protein Tyrosine Kinase (TYRO3, Accession NM_006293), a gene which may be involved in cell adhesion processes, particularly in the central nervous system. Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with TYRO3. The function of TYRO3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM711.ALK7 (Accession XM_065712) is another VGAM2261 host target gene. ALK7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ALK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALK7 BINDING SITE, designated SEQ ID:37294, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77384] Another function of VGAM2261 is therefore inhibition of ALK7 (Accession XM_065712). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALK7. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375) is another VGAM2261 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33512, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77385] Another function of VGAM2261 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. DC-TM4F2 (Accession NM_030927) is another VGAM2261 host target gene. DC-TM4F2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DC-TM4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DC-TM4F2 BINDING SITE, designated SEQ ID:25197, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77386] Another function of VGAM2261 is therefore inhibition of DC-TM4F2 (Accession NM_030927). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DC-TM4F2. Dynactin 4 (p62) (DCTN4, Accession XM_041993) is another VGAM2261 host target gene. DCTN4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCTN4 BINDING SITE, designated SEQ ID:33664, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77387] Another function of VGAM2261 is therefore inhibition of Dynactin 4 (p62) (DCTN4, Accession XM_041993). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN4. FLJ22127 (Accession NM_022775) is another VGAM2261 host target gene. FLJ22127 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ22127 BINDING SITE, designated SEQ ID:23041, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77388] Another function of VGAM2261 is therefore inhibition of FLJ22127 (Accession NM_022775). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22127. FLJ23447 (Accession NM_024825) is another VGAM2261 host target gene. FLJ23447 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23447 BINDING SITE, designated SEQ ID:24217, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77389] Another function of VGAM2261 is therefore inhibition of FLJ23447 (Accession NM_024825). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23447. KIAA0323 (Accession XM_032634) is another VGAM2261 host target gene. KIAA0323 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31689, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77390] Another function of VGAM2261 is therefore inhibition of KIAA0323 (Accession XM_032634). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA1045 (Accession XM_048592) is another VGAM2261 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35198, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77391] Another function of VGAM2261 is therefore inhibition of

KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1509 (Accession XM_029353) is another VGAM2261 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30873, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77392] Another function of VGAM2261 is therefore inhibition of KIAA1509 (Accession XM_029353). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854) is another VGAM2261 host target gene. MESDC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MESDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:35890, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77393] Another function of VGAM2261 is therefore inhibition of Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2. MGC11352 (Accession XM_035941) is another VGAM2261 host target gene. MGC11352 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11352 BINDING SITE, designated SEQ ID:32355, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77394] Another function of VGAM2261 is therefore inhibition of MGC11352 (Accession XM_035941). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC11352. LOC147645 (Accession XM_085831) is another VGAM2261 host target gene. LOC147645 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147645 BINDING SITE, designated SEQ ID:38358, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77395] Another function of VGAM2261 is therefore inhibition of LOC147645 (Accession XM_085831). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147645. LOC151742 (Accession NM_139245) is another VGAM2261 host target gene. LOC151742 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151742 BINDING SITE, designated SEQ ID:29242, to

the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77396] Another function of VGAM2261 is therefore inhibition of LOC151742 (Accession NM_139245). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151742. LOC154790 (Accession XM_088044) is another VGAM2261 host target gene. LOC154790 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154790 BINDING SITE, designated SEQ ID:39490, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77397] Another function of VGAM2261 is therefore inhibition of LOC154790 (Accession XM_088044). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154790. LOC219914 (Accession XM_167788) is another VGAM2261 host target gene. LOC219914 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC219914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219914 BINDING SITE, designated SEQ ID:44815, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77398] Another function of VGAM2261 is therefore inhibition of LOC219914 (Accession XM_167788). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219914. LOC222008 (Accession XM_168361) is another VGAM2261 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:45123, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77399] Another function of VGAM2261 is therefore inhibition of LOC222008 (Accession XM_168361). Accordingly, utilities

of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222008. LOC256979 (Accession XM_171162) is another VGAM2261 host target gene. LOC256979 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256979 BINDING SITE, designated SEQ ID:45951, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77400] Another function of VGAM2261 is therefore inhibition of LOC256979 (Accession XM_171162). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256979. LOC56181 (Accession XM_170954) is another VGAM2261 host target gene. LOC56181 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC56181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC56181 BINDING SITE, designated SEQ ID:45738, to the nucleotide sequence of VGAM2261 RNA, herein designated VGAM RNA, also designated SEQ ID:4972.

[77401] Another function of VGAM2261 is therefore inhibition of LOC56181 (Accession XM_170954). Accordingly, utilities of VGAM2261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56181. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2262 (VGAM2262) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77402] VGAM2262 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2262 was detected is described hereinabove with reference to Figs. 1-8.

[77403] VGAM2262 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2262 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77404] VGAM2262 gene encodes a VGAM2262 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2262 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2262 precursor RNA is designated SEQ ID:2248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2248 is located at position 17900 relative to the genome of Alcelaphine Herpesvirus 1.

[77405] VGAM2262 precursor RNA folds onto itself, forming VGAM2262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77406] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2262 folded precursor RNA into VGAM2262 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2262 RNA is designated SEQ ID:4973, and is provided hereinbelow with reference to the sequence listing part.

[77407] VGAM2262 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2262 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77408] VGAM2262 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2262 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2262 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77409] The complementary binding of VGAM2262 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2262 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2262 host target RNA into VGAM2262 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77410] It is appreciated that VGAM2262 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2262 host target genes. The mRNA of each one of this plurality of VGAM2262 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2262 RNA, herein designated VGAM RNA, and which when bound by VGAM2262 RNA causes inhibition of translation of respective one or more VGAM2262 host target proteins.

[77411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2262 gene, herein designated VGAM GENE, on one or more VGAM2262 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77412] It is yet further appreciated that a function of VGAM2262 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2262 correlate with, and may be deduced from, the identity of the host target genes which VGAM2262 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77413] Nucleotide sequences of the VGAM2262 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2262 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2262 are further described hereinbelow with reference to Table 1.

[77414] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2262 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2262 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77415] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2262 gene, herein designated VGAM is inhibition of expression of VGAM2262 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2262 correlate with, and may be deduced from, the identity of the target genes which VGAM2262 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77416] Caspase 9, Apoptosis-related Cysteine Protease (CASP9, Accession NM_001229) is a VGAM2262 host target gene. CASP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP9 BINDING SITE, designated SEQ ID:6898, to the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, also designated SEQ ID:4973.

[77417] A function of VGAM2262 is therefore inhibition of Cas-

pase 9, Apoptosis-related Cysteine Protease (CASP9, Accession NM_001229). Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP9. DKFZP586A011 (Accession NM_015416) is another VGAM2262 host target gene. DKFZP586A011 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586A011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586A011 BINDING SITE, designated SEQ ID:17716, to the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, also designated SEQ ID:4973.

[77418] Another function of VGAM2262 is therefore inhibition of DKFZP586A011 (Accession NM_015416). Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586A011. HSU24186 (Accession NM_013347) is another VGAM2262 host target gene. HSU24186 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSU24186, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU24186 BINDING SITE, designated SEQ ID:14990, to the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, also designated SEQ ID:4973.

[77419] Another function of VGAM2262 is therefore inhibition of HSU24186 (Accession NM_013347). Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU24186. KIAA1497 (Accession XM_041431) is another VGAM2262 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33523, to the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, also designated SEQ ID:4973.

[77420] Another function of VGAM2262 is therefore inhibition of KIAA1497 (Accession XM_041431). Accordingly, utilities of VGAM2262 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1497. Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379) is another VGAM2262 host target gene. MAN1C1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAN1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1C1 BINDING SITE, designated SEQ ID:21643, to the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, also designated SEQ ID:4973.

[77421] Another function of VGAM2262 is therefore inhibition of Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379). Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1C1. PRO0902 (Accession NM_053057) is another VGAM2262 host target gene. PRO0902 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of PRO0902 BINDING SITE, designated SEQ ID:27605, to the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, also designated SEQ ID:4973.

[77422] Another function of VGAM2262 is therefore inhibition of PRO0902 (Accession NM_053057). Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902. LOC222159 (Accession XM_168421) is another VGAM2262 host target gene. LOC222159 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222159 BINDING SITE, designated SEQ ID:45147, to the nucleotide sequence of VGAM2262 RNA, herein designated VGAM RNA, also designated SEQ ID:4973.

[77423] Another function of VGAM2262 is therefore inhibition of LOC222159 (Accession XM_168421). Accordingly, utilities of VGAM2262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222159. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2263 (VGAM2263) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77424] VGAM2263 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2263 was detected is described hereinabove with reference to Figs. 1-8.

[77425] VGAM2263 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2263 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77426] VGAM2263 gene encodes a VGAM2263 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2263 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2263 precursor RNA is designated SEQ ID:2249, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2249 is located at position 27186 relative to the genome of Alcelaphine Herpesvirus 1.

[77427] VGAM2263 precursor RNA folds onto itself, forming VGAM2263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77428] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2263 folded precursor RNA into VGAM2263 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2263 RNA is designated SEQ ID:4974, and is provided hereinbelow with reference to the sequence listing part.

[77429] VGAM2263 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2263 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77430] VGAM2263 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2263 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2263 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2263 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77431] The complementary binding of VGAM2263 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2263 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2263 host target RNA into VGAM2263 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77432] It is appreciated that VGAM2263 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2263 host target genes. The mRNA of each one of this plurality of VGAM2263 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2263 RNA, herein designated VGAM RNA, and which when bound by VGAM2263 RNA causes inhibition of translation of respective one or more

VGAM2263 host target proteins.

[77433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2263 gene, herein designated VGAM GENE, on one or more VGAM2263 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77434] It is yet further appreciated that a function of VGAM2263 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM2263 correlate with, and may be deduced from, the identity of the host target genes which VGAM2263 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77435] Nucleotide sequences of the VGAM2263 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2263 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2263 are further described hereinbelow with reference to Table 1.

[77436] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2263 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2263 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77437] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2263 gene, herein designated VGAM is inhibition of expression of VGAM2263 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2263 correlate with, and may be deduced from, the identity of the target genes which VGAM2263 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77438] GTP Cyclohydrolase 1 (dopa-responsive dystonia) (GCH1, Accession NM_000161) is a VGAM2263 host target gene. GCH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GCH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCH1 BINDING SITE, designated SEQ ID:5665, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77439] A function of VGAM2263 is therefore inhibition of GTP Cyclohydrolase 1 (dopa-responsive dystonia) (GCH1, Accession NM_000161). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCH1. RAN Binding Protein 2-like 1 (RANBP2L1, Accession NM_032260) is another VGAM2263 host target gene. RANBP2L1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RANBP2L1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP2L1 BINDING SITE, designated SEQ ID:26004, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77440] Another function of VGAM2263 is therefore inhibition of RAN Binding Protein 2-like 1 (RANBP2L1, Accession NM_032260). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP2L1. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068) is another VGAM2263 host target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11510, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77441] Another function of VGAM2263 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession

NM_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM_002251) is another VGAM2263 host target gene. KCNS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS1 BINDING SITE, designated SEQ ID:8045, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77442] Another function of VGAM2263 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM_002251). Accordingly, utilities of VGAM2263 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with KCNS1. KIAA0446 (Accession XM_044155) is another VGAM2263 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34155, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77443] Another function of VGAM2263 is therefore inhibition of KIAA0446 (Accession XM_044155). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. KIAA1828 (Accession XM_057526) is another VGAM2263 host target gene. KIAA1828 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1828 BINDING SITE, designated SEQ ID:36525, to the

nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77444] Another function of VGAM2263 is therefore inhibition of KIAA1828 (Accession XM_057526). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1828. Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598) is another VGAM2263 host target gene. ZDHHC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:18691, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77445] Another function of VGAM2263 is therefore inhibition of Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC3. LOC130813 (Accession XM_065904) is another VGAM2263 host target

gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37308, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77446] Another function of VGAM2263 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC150759 (Accession XM_086995) is another VGAM2263 host target gene. LOC150759 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150759 BINDING SITE, designated SEQ ID:39014, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77447] Another function of VGAM2263 is therefore inhibition of LOC150759 (Accession XM_086995). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150759. LOC151323 (Accession XM_087168) is another VGAM2263 host target gene. LOC151323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151323 BINDING SITE, designated SEQ ID:39103, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77448] Another function of VGAM2263 is therefore inhibition of LOC151323 (Accession XM_087168). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151323. LOC200399 (Accession XM_114226) is another VGAM2263 host target gene. LOC200399 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200399, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200399 BINDING SITE, designated SEQ ID:42811, to the nucleotide sequence of VGAM2263 RNA, herein designated VGAM RNA, also designated SEQ ID:4974.

[77449] Another function of VGAM2263 is therefore inhibition of LOC200399 (Accession XM_114226). Accordingly, utilities of VGAM2263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2264 (VGAM2264) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77450] VGAM2264 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2264 was detected is described hereinabove with reference to Figs. 1-8.

[77451] VGAM2264 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2264 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[77452] VGAM2264 gene encodes a VGAM2264 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2264 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2264 precursor RNA is designated SEQ ID:2250, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2250 is located at position 20319 relative to the genome of Alcelaphine Herpesvirus 1.

[77453] VGAM2264 precursor RNA folds onto itself, forming VGAM2264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77454] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2264 folded precursor RNA into VGAM2264

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2264 RNA is designated SEQ ID:4975, and is provided hereinbelow with reference to the sequence listing part.

[77455] VGAM2264 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2264 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77456] VGAM2264 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2264 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2264 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77457] The complementary binding of VGAM2264 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2264 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2264 host target RNA into VGAM2264 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[77458] It is appreciated that VGAM2264 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2264 host target genes. The mRNA of each one of this plurality of VGAM2264 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2264 RNA, herein designated VGAM RNA, and which when bound by VGAM2264 RNA causes inhibition of translation of respective one or more VGAM2264 host target proteins.

[77459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2264 gene, herein designated VGAM GENE, on one or more VGAM2264 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77460] It is yet further appreciated that a function of VGAM2264 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2264 correlate with, and may be deduced from, the identity of the host target genes which VGAM2264 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77461] Nucleotide sequences of the VGAM2264 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2264 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2264 are further described hereinbelow with reference to Table 1.

[77462] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2264 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2264 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[77463] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2264 gene, herein designated VGAM is inhibition of expression of VGAM2264 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2264 correlate with, and may be deduced from, the identity of the target genes which VGAM2264 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77464] COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM_004375) is a VGAM2264 host target gene. COX11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX11 BINDING SITE, designated SEQ ID:10593, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77465] A function of VGAM2264 is therefore inhibition of COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM_004375). Accordingly, utilities of

VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX11. Chemokine (C-X-C motif) Ligand 13 (B-cell chemoattractant) (CXCL13, Accession NM_006419) is another VGAM2264 host target gene. CXCL13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXCL13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL13 BINDING SITE, designated SEQ ID:13135, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77466] Another function of VGAM2264 is therefore inhibition of Chemokine (C-X-C motif) Ligand 13 (B-cell chemoattractant) (CXCL13, Accession NM_006419), a gene which plays a role in directing the migration of b lymphocytes to follicles . Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL13. The function of CXCL13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1276.Myotubularin Related Protein 6 (MTMR6, Accession XM_167970) is another VGAM2264 host target gene. MTMR6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTMR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR6 BINDING SITE, designated SEQ ID:44937, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77467] Another function of VGAM2264 is therefore inhibition of Myotubularin Related Protein 6 (MTMR6, Accession XM_167970). Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR6. Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259) is another VGAM2264 host target gene. HEY2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of HEY2 BINDING SITE, designated SEQ ID:14565, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77468] Another function of VGAM2264 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259). Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEY2. KIAA0546 (Accession XM_049055) is another VGAM2264 host target gene. KIAA0546 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0546 BINDING SITE, designated SEQ ID:35330, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77469] Another function of VGAM2264 is therefore inhibition of KIAA0546 (Accession XM_049055). Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0546. KIAA1511 (Accession XM_046581) is another

VGAM2264 host target gene. KIAA1511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1511 BINDING SITE, designated SEQ ID:34755, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77470] Another function of VGAM2264 is therefore inhibition of KIAA1511 (Accession XM_046581). Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1511. Phosphodiesterase 1C, Calmodulin-dependent 70kDa (PDE1C, Accession NM_005020) is another VGAM2264 host target gene. PDE1C BINDING SITE1 and PDE1C BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PDE1C, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE1C BINDING SITE1 and PDE1C BINDING SITE2, designated SEQ ID:11458 and SEQ ID:11459 re-

spectively, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77471] Another function of VGAM2264 is therefore inhibition of Phosphodiesterase 1C, Calmodulin-dependent 70kDa (PDE1C, Accession NM_005020). Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE1C. LOC169436 (Accession XM_095696) is another VGAM2264 host target gene. LOC169436 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC169436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169436 BINDING SITE, designated SEQ ID:40277, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77472] Another function of VGAM2264 is therefore inhibition of LOC169436 (Accession XM_095696). Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169436. LOC92399 (Accession NM_138777) is an-

other VGAM2264 host target gene. LOC92399 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92399 BINDING SITE, designated SEQ ID:29012, to the nucleotide sequence of VGAM2264 RNA, herein designated VGAM RNA, also designated SEQ ID:4975.

[77473] Another function of VGAM2264 is therefore inhibition of LOC92399 (Accession NM_138777). Accordingly, utilities of VGAM2264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2265 (VGAM2265) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77474] VGAM2265 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2265 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[77475] VGAM2265 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77476] VGAM2265 gene encodes a VGAM2265 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2265 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2265 precursor RNA is designated SEQ ID:2251, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2251 is located at position 27645 relative to the genome of Alcelaphine Herpesvirus 1.

[77477] VGAM2265 precursor RNA folds onto itself, forming VGAM2265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77478] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2265 folded precursor RNA into VGAM2265 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2265 RNA is designated SEQ ID:4976, and is provided hereinbelow with reference to the sequence listing part.

[77479] VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2265 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77480] VGAM2265 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2265 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2265 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2265 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77481] The complementary binding of VGAM2265 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2265 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2265 host target RNA into VGAM2265 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77482] It is appreciated that VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2265 host target genes. The mRNA of each one of this plurality of VGAM2265 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2265 RNA, herein designated VGAM RNA, and which when bound by VGAM2265 RNA causes inhibition of translation of respective one or more VGAM2265 host target proteins.

[77483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2265 gene, herein designated VGAM GENE, on one or more VGAM2265 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77484] It is yet further appreciated that a function of VGAM2265 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2265 correlate with, and may be deduced from, the identity of the host target genes which VGAM2265 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77485] Nucleotide sequences of the VGAM2265 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2265 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2265 are further described hereinbelow with reference to Table 1.

[77486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2265 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2265 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77487] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2265 gene, herein designated VGAM is inhibition of expression of VGAM2265 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2265 correlate with, and may be deduced from, the identity of the target genes which VGAM2265 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77488] Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174) is a VGAM2265 host target gene. ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGAP6, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2, designated SEQ ID:6839 and SEQ ID:15083 respectively, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77489] A function of VGAM2265 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM_002800) is another VGAM2265 host target gene. PSMB9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSMB9, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMB9 BINDING SITE, designated SEQ ID:8674, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77490] Another function of VGAM2265 is therefore inhibition of Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM_002800), a gene which is one component of a multicatalytic proteinase complex. Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMB9. The function of PSMB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1915.CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663) is another VGAM2265 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGGBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGGBP1 BINDING SITE,

designated SEQ ID:9736, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77491] Another function of VGAM2265 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. Dual Specificity Phosphatase 10 (DUSP10, Accession NM_007207) is another VGAM2265 host target gene. DUSP10 BINDING SITE1 and DUSP10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DUSP10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP10 BINDING SITE1 and DUSP10 BINDING SITE2, designated SEQ ID:14070 and SEQ ID:29554 respectively, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77492] Another function of VGAM2265 is therefore inhibition of Dual Specificity Phosphatase 10 (DUSP10, Accession NM_007207). Accordingly, utilities of VGAM2265 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP10. KIAA0140 (Accession NM_014661) is another VGAM2265 host target gene. KIAA0140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0140 BINDING SITE, designated SEQ ID:16106, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77493] Another function of VGAM2265 is therefore inhibition of KIAA0140 (Accession NM_014661). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0140. KIAA1211 (Accession XM_044178) is another VGAM2265 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1211 BINDING SITE, designated SEQ ID:34157, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77494] Another function of VGAM2265 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. KIAA1676 (Accession XM_167612) is another VGAM2265 host target gene. KIAA1676 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1676 BINDING SITE, designated SEQ ID:44723, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77495] Another function of VGAM2265 is therefore inhibition of KIAA1676 (Accession XM_167612). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1676. Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_033044) is another VGAM2265

host target gene. MACF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MACF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACF1 BINDING SITE, designated SEQ ID:26933, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77496] Another function of VGAM2265 is therefore inhibition of Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_033044). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACF1. Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580) is another VGAM2265 host target gene. MKRN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKRN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN2 BINDING SITE, designated SEQ ID:35855, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA,

also designated SEQ ID:4976.

[77497] Another function of VGAM2265 is therefore inhibition of Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN2. POPX1 (Accession NM_014906) is another VGAM2265 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17114, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77498] Another function of VGAM2265 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. TRIP-Br2 (Accession NM_014755) is another VGAM2265 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16478, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77499] Another function of VGAM2265 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC144997 (Accession XM_096702) is another VGAM2265 host target gene. LOC144997 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144997 BINDING SITE, designated SEQ ID:40481, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77500] Another function of VGAM2265 is therefore inhibition of LOC144997 (Accession XM_096702). Accordingly, utilities

of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144997. LOC159053 (Accession XM_099021) is another VGAM2265 host target gene. LOC159053 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC159053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159053 BINDING SITE, designated SEQ ID:42059, to the nucleotide sequence of VGAM2265 RNA, herein designated VGAM RNA, also designated SEQ ID:4976.

[77501] Another function of VGAM2265 is therefore inhibition of LOC159053 (Accession XM_099021). Accordingly, utilities of VGAM2265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159053. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2266 (VGAM2266) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77502] VGAM2266 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2266 was detected is described hereinabove with reference to Figs. 1-8.

[77503] VGAM2266 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2266 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77504] VGAM2266 gene encodes a VGAM2266 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2266 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2266 precursor RNA is designated SEQ ID:2252, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2252 is located at position 27936 relative to the genome of Alcelaphine Herpesvirus 1.

[77505] VGAM2266 precursor RNA folds onto itself, forming VGAM2266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77506] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2266 folded precursor RNA into VGAM2266 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2266 RNA is designated SEQ ID:4977, and is provided hereinbelow with reference to the sequence listing part.

[77507] VGAM2266 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2266 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[77508] VGAM2266 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2266 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2266 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77509] The complementary binding of VGAM2266 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2266 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2266 host target RNA into VGAM2266 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77510] It is appreciated that VGAM2266 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2266 host target genes. The mRNA of each one of this plurality of VGAM2266 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2266 RNA, herein designated VGAM RNA, and which when bound by VGAM2266 RNA causes inhibition of translation of respective one or more VGAM2266 host target proteins.

[77511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2266 gene, herein designated VGAM GENE, on one or more VGAM2266 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77512] It is yet further appreciated that a function of VGAM2266 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2266 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2266 correlate with, and may be deduced from, the identity of the host target genes which VGAM2266 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77513] Nucleotide sequences of the VGAM2266 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2266 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2266 are further described hereinbelow with reference to Table 1.

[77514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2266 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2266 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77515] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2266 gene, herein designated VGAM is inhibition of expression of VGAM2266 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2266 correlate with, and may be deduced from, the identity of the target genes which VGAM2266 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77516] Inhibitor of Kappa Light Polypeptide Gene Enhancer In B-cells, Kinase Beta (IKBKB, Accession XM_032491) is a

VGAM2266 host target gene. IKBKB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IKBKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IKBKB BINDING SITE, designated SEQ ID:31662, to the nucleotide sequence of VGAM2266 RNA, herein designated VGAM RNA, also designated SEQ ID:4977.

[77517] A function of VGAM2266 is therefore inhibition of Inhibitor of Kappa Light Polypeptide Gene Enhancer In B-cells, Kinase Beta (IKBKB, Accession XM_032491), a gene which leads to the dissociation of the inhibitor/nf-kappa-b complex. Accordingly, utilities of VGAM2266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IKBKB. The function of IKBKB has been established by previous studies. Woronicz et al. (1997) observed that IKK-beta activated NF-kappa-B when overexpressed and phosphorylated serine residues 32 and 36 of I-kappa-B-alpha and 19 and 23 of I-kappa-B-beta. The activity of IKK-beta was stimulated by TNF (OMIM Ref. No. 191160) and IL1. IKK-alpha and IKK-beta formed heterodimers that interacted with

NF-kappa-B-inducing kinase (NIK; 604655). Overexpression of catalytically inactive IKK-beta blocked cytokine-induced NF-kappa-B activation. Thus, the active I-kappa-B kinase complex appears to require 3 distinct protein kinases: IKK-alpha, IKK-beta, and NIK. Mercurio et al. (1997) found that mutations in IKK2 had a more pronounced effect upon NFKB activation than did comparable mutations in IKK1. Ozes et al. (1999) showed that AKT1 (OMIM Ref. No. 164730) is involved in the activation of NFKB1 by TNF, following the activation of phosphatidylinositol 3-kinase (PIK3; OMIM Ref. No. 171834). Constitutively active AKT1 induces NFKB1 activity, mediated by phosphorylation of IKK-alpha at threonine 23, which can be blocked by activated NIK. Conversely, NIK activation of NFKB1, mediated by phosphorylation of IKK-alpha at serine 176, is blocked by an AKT1 mutant lacking kinase activity (i.e., kinase dead AKT), indicating that both AKT1 and NIK are necessary for TNF activation of NFKB1 through the phosphorylation of IKK-alpha. IKK-beta is not phosphorylated by either NIK or AKT1 and is apparently differentially regulated. Tang et al. (2001) reported that IKK-beta is specifically proteolyzed by caspase-3 (OMIM Ref. No. 600636)-related caspases at aspartic acid

residues 78, 242, 373, and 546 during TNF-alpha-induced apoptosis. Proteolysis of IKK-beta eliminated its enzymatic activity, interfered with IKK activation, and promoted TNF-alpha killing. Point mutations that abrogated IKK-beta proteolysis generated a caspase-resistant IKK-beta mutant that suppressed TNF-alpha-induced apoptosis. This study demonstrated that TNF-alpha-induced apoptosis requires caspase-mediated proteolysis of IKK-beta. Rossi et al. (2000) demonstrated a novel mechanism of antiinflammatory activity that was based on the direct inhibition and modification of the IKK-beta subunit of IKK. Since IKK-beta is responsible for the activation of NF-kappa-B by proinflammatory stimuli, Rossi et al. (2000) suggested that their findings explained how cyclopentenone prostaglandins function and can be used to improve the utility of COX2 (OMIM Ref. No. 600262) inhibitors. May et al. (2000) determined that an N-terminal alpha-helical region of NEMO (OMIM Ref. No. 300248) associates with a region of IKKA and IKKB that they termed the NBD for 'NEMO-binding domain.' The NBD is a 6-amino acid C-terminal segment within the region denoted alpha-2 of IKKA and IKKB. Wildtype, but not mutant, NDB peptide inhibited cytokine-induced NFKB ac-

tivation and ameliorated experimental acute inflammation Animal model experiments lend further support to the function of IKBKB. Pasparakis et al. (2002) used Cre/loxP-mediated gene targeting to investigate the function of IKK2 specifically in epidermal keratinocytes. IKK2 deficiency inhibits NFKB activation, but does not lead to cell-autonomous hyperproliferation or impaired differentiation of keratinocytes. Mice with epidermis-specific deletion of IKK2 develop a severe inflammatory skin disease, which is caused by a tumor necrosis factor (OMIM Ref. No. 191160)-mediated, alpha-beta T-cell-independent inflammatory response that develops in the skin shortly after birth. Pasparakis et al. (2002) concluded that the critical function of IKK2-mediated NFKB activity in epidermal keratinocytes is to regulate mechanisms that maintain the immune homeostasis of the skin.

[77518] It is appreciated that the abovementioned animal model for IKBKB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[77519] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[77520] Pasparakis, M.; Courtois, G.; Hafner, M.; Schmidt-Supprian, M.; Nenci, A.; Toksoy, A.; Krampert, M.; Goebeler, M.; Gillitzer, R.; Israel, A.; Krieg, T.; Rajewsky, K.; Haase, I. : TNF-mediated inflammatory skin disease in mice with epidermis-specific deletion of IKK2. Nature 417: 861-866, 2002. ; and

[77521] May, M. J.; D'Acquisto, F.; Madge, L. A.; Glockner, J.; Pober, J. S.; Ghosh, S. : Selective inhibition of NF-kappa-B activation by a peptide that blocks the interaction of NEMO with the.

[77522] Further studies establishing the function and utilities of IKBKB are found in John Hopkins OMIM database record ID 603258, and in sited publications numbered 8500-8176, 9198, 9201, 12739-850 and 12225 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.NORE1 (Accession NM_031437) is another VGAM2266 host target gene. NORE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NORE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NORE1 BINDING SITE, designated SEQ ID:25444, to the nucleotide se-

quence of VGAM2266 RNA, herein designated VGAM RNA, also designated SEQ ID:4977.

[77523] Another function of VGAM2266 is therefore inhibition of NORE1 (Accession NM_031437), a gene which may modulate intracellular signal transduction pathways. Accordingly, utilities of VGAM2266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NORE1. The function of NORE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM_084514) is another VGAM2266 host target gene. HSPCAL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPCAL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPCAL3 BINDING SITE, designated SEQ ID:37617, to the nucleotide sequence of VGAM2266 RNA, herein designated VGAM RNA, also designated SEQ ID:4977.

[77524] Another function of VGAM2266 is therefore inhibition of Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Ac-

cession XM_084514). Accordingly, utilities of VGAM2266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPCAL3. RTBDN (Accession NM_031429) is another VGAM2266 host target gene. RTBDN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RTBDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTBDN BINDING SITE, designated SEQ ID:25424, to the nucleotide sequence of VGAM2266 RNA, herein designated VGAM RNA, also designated SEQ ID:4977.

[77525] Another function of VGAM2266 is therefore inhibition of RTBDN (Accession NM_031429). Accordingly, utilities of VGAM2266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTBDN. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2267 (VGAM2267) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77526] VGAM2267 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2267 was detected is described hereinabove with reference to Figs. 1-8.

[77527] VGAM2267 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2267 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77528] VGAM2267 gene encodes a VGAM2267 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2267 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2267 precursor RNA is designated SEQ ID:2253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2253 is located at position 29434 relative to the genome of Alcelaphine Herpesvirus 1.

[77529] VGAM2267 precursor RNA folds onto itself, forming VGAM2267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77530] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2267 folded precursor RNA into VGAM2267 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2267 RNA is designated SEQ ID:4978, and is provided hereinbelow with reference to the sequence listing part.

[77531] VGAM2267 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2267 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[77532] VGAM2267 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2267 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2267 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77533] The complementary binding of VGAM2267 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2267 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2267 host target RNA into VGAM2267 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77534] It is appreciated that VGAM2267 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2267 host target genes. The mRNA of each one of this plurality of VGAM2267 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2267 RNA, herein designated VGAM RNA, and which when bound by VGAM2267 RNA causes inhibition of translation of respective one or more VGAM2267 host target proteins.

[77535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2267 gene, herein designated VGAM GENE, on one or more VGAM2267 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77536] It is yet further appreciated that a function of VGAM2267 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2267 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2267 correlate with, and may be deduced from, the identity of the host target genes which VGAM2267 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77537] Nucleotide sequences of the VGAM2267 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2267 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2267 are further described hereinbelow with reference to Table 1.

[77538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2267 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2267 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77539] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2267 gene, herein designated VGAM is inhibition of expression of VGAM2267 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2267 correlate with, and may be deduced from, the identity of the target genes which VGAM2267 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77540] Histamine Receptor H1 (HRH1, Accession NM_000861) is a VGAM2267 host target gene. HRH1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by HRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH1 BINDING SITE, designated SEQ ID:6524, to the nucleotide sequence of VGAM2267 RNA, herein designated VGAM RNA, also designated SEQ ID:4978.

[77541] A function of VGAM2267 is therefore inhibition of Histamine Receptor H1 (HRH1, Accession NM_000861), a gene which stimulates the synthesis of inositol phosphate. Accordingly, utilities of VGAM2267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH1. The function of HRH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766.DKFZP564I122 (Accession XM_032397) is another VGAM2267 host target gene. DKFZP564I122 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of DKFZP564I122 BINDING SITE, designated SEQ ID:31643, to the nucleotide sequence of VGAM2267 RNA, herein designated VGAM RNA, also designated SEQ ID:4978.

[77542] Another function of VGAM2267 is therefore inhibition of DKFZP564I122 (Accession XM_032397). Accordingly, utilities of VGAM2267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I122. Integrin, Alpha 10 (ITGA10, Accession XM_002097) is another VGAM2267 host target gene. ITGA10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITGA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA10 BINDING SITE, designated SEQ ID:29866, to the nucleotide sequence of VGAM2267 RNA, herein designated VGAM RNA, also designated SEQ ID:4978.

[77543] Another function of VGAM2267 is therefore inhibition of Integrin, Alpha 10 (ITGA10, Accession XM_002097). Accordingly, utilities of VGAM2267 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ITGA10. YKT6 (Accession NM_006555) is another VGAM2267 host target gene. YKT6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YKT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YKT6 BINDING SITE, designated SEQ ID:13321, to the nucleotide sequence of VGAM2267 RNA, herein designated VGAM RNA, also designated SEQ ID:4978.

[77544] Another function of VGAM2267 is therefore inhibition of YKT6 (Accession NM_006555). Accordingly, utilities of VGAM2267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YKT6. ZFD25 (Accession NM_016220) is another VGAM2267 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18324, to the nucleotide sequence of VGAM2267 RNA, herein designated VGAM RNA, also designated SEQ

ID:4978.

[77545] Another function of VGAM2267 is therefore inhibition of ZFD25 (Accession NM_016220). Accordingly, utilities of VGAM2267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2268 (VGAM2268) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77546] VGAM2268 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2268 was detected is described hereinabove with reference to Figs. 1-8.

[77547] VGAM2268 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77548] VGAM2268 gene encodes a VGAM2268 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2268 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2268 precursor RNA is designated SEQ ID:2254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2254 is located at position 29021 relative to the genome of Alcelaphine Herpesvirus 1.

[77549] VGAM2268 precursor RNA folds onto itself, forming VGAM2268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77550] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2268 folded precursor RNA into VGAM2268 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2268 RNA is designated SEQ ID:4979, and is provided hereinbelow with reference to the sequence listing part.

[77551] VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2268 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77552] VGAM2268 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2268 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2268 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77553] The complementary binding of VGAM2268 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2268 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2268 host target RNA into VGAM2268 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77554] It is appreciated that VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2268 host target genes. The mRNA of each one of this plurality of VGAM2268 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2268 RNA, herein designated VGAM RNA, and which when bound by VGAM2268 RNA causes inhibition of translation of respective one or more VGAM2268 host target proteins.

[77555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2268 gene, herein designated VGAM GENE, on one or more VGAM2268 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77556] It is yet further appreciated that a function of VGAM2268 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2268 correlate with, and may be deduced from, the identity of the host target genes which VGAM2268 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77557] Nucleotide sequences of the VGAM2268 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2268 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2268 are further described hereinbelow with reference to Table 1.

[77558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2268 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2268 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[77559] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2268 gene, herein designated VGAM is inhibition of expression of VGAM2268 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2268 correlate with, and may be deduced from, the identity of the target genes which VGAM2268 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77560] IRTA1 (Accession NM_031282) is a VGAM2268 host target gene. IRTA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA1 BINDING SITE, designated SEQ ID:25304, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77561] A function of VGAM2268 is therefore inhibition of IRTA1 (Accession NM_031282). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA1. Methylthioadenosine Phosphorylase (MTAP, Accession

NM_002451) is another VGAM2268 host target gene. MTAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTAP BINDING SITE, designated SEQ ID:8288, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77562] Another function of VGAM2268 is therefore inhibition of Methylthioadenosine Phosphorylase (MTAP, Accession NM_002451), a gene which plays a major role in polyamine metabolism. Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTAP. The function of MTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM68.Prospero-related Homeobox 1 (PROX1, Accession NM_002763) is another VGAM2268 host target gene. PROX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PROX1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROX1 BINDING SITE, designated SEQ ID:8652, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77563] Another function of VGAM2268 is therefore inhibition of Prospero-related Homeobox 1 (PROX1, Accession NM_002763), a gene which may regulate gene expression and development of postmitotic undifferentiated young neurons. Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROX1. The function of PROX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226) is another VGAM2268 host target gene. RNPEPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNPEPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RNPEPL1 BINDING SITE, designated SEQ ID:20164, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77564] Another function of VGAM2268 is therefore inhibition of Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPEPL1. V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465) is another VGAM2268 host target gene. AKT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT3 BINDING SITE, designated SEQ ID:11961, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77565] Another function of VGAM2268 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465).

Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT3. Chromosome 20 Open Reading Frame 38 (C20orf38, Accession NM_018327) is another VGAM2268 host target gene. C20orf38 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf38 BINDING SITE, designated SEQ ID:20324, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77566] Another function of VGAM2268 is therefore inhibition of Chromosome 20 Open Reading Frame 38 (C20orf38, Accession NM_018327). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf38. KIAA1160 (Accession NM_020701) is another VGAM2268 host target gene. KIAA1160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1160 BINDING SITE, designated SEQ ID:21851, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77567] Another function of VGAM2268 is therefore inhibition of KIAA1160 (Accession NM_020701). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1160. KIAA1198 (Accession XM_032674) is another VGAM2268 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31715, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77568] Another function of VGAM2268 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1198. KOC1 (Accession XM_165847) is another VGAM2268 host target gene. KOC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KOC1 BINDING SITE, designated SEQ ID:43779, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77569] Another function of VGAM2268 is therefore inhibition of KOC1 (Accession XM_165847). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KOC1. Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134) is another VGAM2268 host target gene. LMOD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LMOD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMOD1 BINDING SITE, designated SEQ ID:14445, to the nucleotide sequence of VGAM2268 RNA,

herein designated VGAM RNA, also designated SEQ ID:4979.

[77570] Another function of VGAM2268 is therefore inhibition of Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMOD1. Polymerase (DNA directed), Mu (POLM, Accession XM_165867) is another VGAM2268 host target gene. POLM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POLM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLM BINDING SITE, designated SEQ ID:43783, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77571] Another function of VGAM2268 is therefore inhibition of Polymerase (DNA directed), Mu (POLM, Accession XM_165867). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLM. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession

XM_028335) is another VGAM2268 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30676, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77572] Another function of VGAM2268 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. Regulatory Factor X, 4 (influences HLA class II expression) (RFX4, Accession NM_032491) is another VGAM2268 host target gene. RFX4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX4 BINDING SITE, designated SEQ

ID:26243, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77573] Another function of VGAM2268 is therefore inhibition of Regulatory Factor X, 4 (influences HLA class II expression) (RFX4, Accession NM_032491). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX4. Rho-related BTB Domain Containing 3 (RHOBTB3, Accession NM_014899) is another VGAM2268 host target gene. RHOBTB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB3 BINDING SITE, designated SEQ ID:17077, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77574] Another function of VGAM2268 is therefore inhibition of Rho-related BTB Domain Containing 3 (RHOBTB3, Accession NM_014899). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RHOBTB3. RLUCL (Accession NM_058192) is another VGAM2268 host target gene. RLUCL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RLUCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RLUCL BINDING SITE, designated SEQ ID:27753, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77575] Another function of VGAM2268 is therefore inhibition of RLUCL (Accession NM_058192). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RLUCL. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958) is another VGAM2268 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10102,

to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77576] Another function of VGAM2268 is therefore inhibition of Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8. Ubiquitin Specific Protease 8 (USP8, Accession NM_005154) is another VGAM2268 host target gene. USP8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP8 BINDING SITE, designated SEQ ID:11632, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77577] Another function of VGAM2268 is therefore inhibition of Ubiquitin Specific Protease 8 (USP8, Accession NM_005154). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP8. LOC144438 (Accession XM_084860) is another VGAM2268 host target

gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37741, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77578] Another function of VGAM2268 is therefore inhibition of LOC144438 (Accession XM_084860). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144438. LOC196955 (Accession XM_085210) is another VGAM2268 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37942, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77579] Another function of VGAM2268 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC200488 (Accession XM_117240) is another VGAM2268 host target gene. LOC200488 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200488 BINDING SITE, designated SEQ ID:43317, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77580] Another function of VGAM2268 is therefore inhibition of LOC200488 (Accession XM_117240). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200488. LOC200940 (Accession XM_114324) is another VGAM2268 host target gene. LOC200940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200940, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200940 BINDING SITE, designated SEQ ID:42875, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77581] Another function of VGAM2268 is therefore inhibition of LOC200940 (Accession XM_114324). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200940. LOC255057 (Accession XM_170903) is another VGAM2268 host target gene. LOC255057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255057 BINDING SITE, designated SEQ ID:45662, to the nucleotide sequence of VGAM2268 RNA, herein designated VGAM RNA, also designated SEQ ID:4979.

[77582] Another function of VGAM2268 is therefore inhibition of LOC255057 (Accession XM_170903). Accordingly, utilities of VGAM2268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255057. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2269 (VGAM2269) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77583] VGAM2269 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2269 was detected is described hereinabove with reference to Figs. 1-8.

[77584] VGAM2269 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77585] VGAM2269 gene encodes a VGAM2269 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2269 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2269 precursor RNA is designated SEQ ID:2255, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2255 is located at position 30842 relative to the genome of Alcelaphine Herpesvirus 1.

[77586] VGAM2269 precursor RNA folds onto itself, forming VGAM2269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77587] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2269 folded precursor RNA into VGAM2269 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2269 RNA is designated SEQ ID:4980, and is provided hereinbelow with reference to the sequence listing part.

[77588] VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2269 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77589] VGAM2269 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2269 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2269 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77590] The complementary binding of VGAM2269 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2269 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2269 host target RNA into VGAM2269 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77591] It is appreciated that VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2269 host target genes. The mRNA of each one of this plurality of VGAM2269 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2269 RNA, herein designated VGAM RNA, and which when bound by VGAM2269 RNA causes

inhibition of translation of respective one or more VGAM2269 host target proteins.

[77592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2269 gene, herein designated VGAM GENE, on one or more VGAM2269 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77593] It is yet further appreciated that a function of VGAM2269 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2269 include diagnosis, prevention and

treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2269 correlate with, and may be deduced from, the identity of the host target genes which VGAM2269 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77594] Nucleotide sequences of the VGAM2269 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2269 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2269 are further described hereinbelow with reference to Table 1.

[77595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2269 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2269 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77596] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2269 gene, herein designated VGAM is inhibition of expression of VGAM2269 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2269 correlate with, and may be deduced from, the identity of the target genes which VGAM2269 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77597] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974) is a VGAM2269 host target gene. AKAP13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43180, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77598] A function of VGAM2269 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM17.Aldehyde Dehydrogenase 3 Family, Member B1 (ALDH3B1, Accession XM_166190) is another VGAM2269 host target gene. ALDH3B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALDH3B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3B1 BINDING SITE, designated SEQ ID:44000, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77599] Another function of VGAM2269 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member B1 (ALDH3B1, Accession XM_166190), a gene which may play a major role in the detoxification of aldehydes generated by alcohol metabolism and lipid peroxidation. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3B1. The function of ALDH3B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2007.Branched Chain

Aminotransferase 1, Cytosolic (BCAT1, Accession XM_038659) is another VGAM2269 host target gene. BCAT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAT1 BINDING SITE, designated SEQ ID:32897, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77600] Another function of VGAM2269 is therefore inhibition of Branched Chain Aminotransferase 1, Cytosolic (BCAT1, Accession XM_038659), a gene which catalyzes of the essential branched chain leucine, isoleucine, and valine. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAT1. The function of BCAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1367.Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession

NM_020630) is another VGAM2269 host target gene. RET BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE, designated SEQ ID:21789, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77601] Another function of VGAM2269 is therefore inhibition of Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020630), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RET. The function of RET and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Regulator of G-protein Signalling 5 (RGS5, Accession NM_003617) is another VGAM2269 host target gene. RGS5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by RGS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS5 BINDING SITE, designated SEQ ID:9680, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77602] Another function of VGAM2269 is therefore inhibition of Regulator of G-protein Signalling 5 (RGS5, Accession NM_003617). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS5. Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631) is another VGAM2269 host target gene. ROBO1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ROBO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE, designated SEQ ID:28588, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77603] Another function of VGAM2269 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999) is another VGAM2269 host target gene. SDC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC4 BINDING SITE, designated SEQ ID:8894, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77604] Another function of VGAM2269 is therefore inhibition of Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999), a gene which is a cell surface proteoglycan.

Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC4. The function of SDC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630) is another VGAM2269 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:12160, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77605] Another function of VGAM2269 is therefore inhibition of Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630), a gene which is a Prostaglandin transporter. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

SLC21A2. The function of SLC21A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83.T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189) is another VGAM2269 host target gene. TAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:9174, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77606] Another function of VGAM2269 is therefore inhibition of T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189), a gene which may help control cell growth and differentiation. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAL1. The function of TAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM172.Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM_003347) is another VGAM2269 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9362, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77607] Another function of VGAM2269 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215.Calsyntenin 1 (CLSTN1, Accession NM_014944) is another VGAM2269 host target gene. CLSTN1 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by CLSTN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN1 BINDING SITE, designated SEQ ID:17258, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77608] Another function of VGAM2269 is therefore inhibition of Calsyntenin 1 (CLSTN1, Accession NM_014944). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN1. D21S2056E (Accession NM_003683) is another VGAM2269 host target gene. D21S2056E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by D21S2056E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D21S2056E BINDING SITE, designated SEQ ID:9790, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77609] Another function of VGAM2269 is therefore inhibition of

D21S2056E (Accession NM_003683). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D21S2056E. Fatty Acid Desaturase 2 (FADS2, Accession NM_004265) is another VGAM2269 host target gene. FADS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FADS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADS2 BINDING SITE, designated SEQ ID:10470, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77610] Another function of VGAM2269 is therefore inhibition of Fatty Acid Desaturase 2 (FADS2, Accession NM_004265). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADS2. FLJ13265 (Accession NM_024877) is another VGAM2269 host target gene. FLJ13265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13265, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13265 BINDING SITE, designated SEQ ID:24314, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77611] Another function of VGAM2269 is therefore inhibition of FLJ13265 (Accession NM_024877). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13265. KIAA1854 (Accession XM_049884) is another VGAM2269 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35538, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77612] Another function of VGAM2269 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1854. KIAA1855 (Accession XM_166453) is another VGAM2269 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44363, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77613] Another function of VGAM2269 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. MGC15854 (Accession NM_145029) is another VGAM2269 host target gene. MGC15854 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC15854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15854 BINDING SITE, designated SEQ ID:29646, to

the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77614] Another function of VGAM2269 is therefore inhibition of MGC15854 (Accession NM_145029). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15854. Tumor Necrosis Factor, Alpha-induced Protein 3 (TNFAIP3, Accession NM_006290) is another VGAM2269 host target gene. TNFAIP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFAIP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP3 BINDING SITE, designated SEQ ID:12980, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77615] Another function of VGAM2269 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 3 (TNFAIP3, Accession NM_006290). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP3. TNF Receptor-associated Factor 6 (TRAF6, Acces-

sion NM_004620) is another VGAM2269 host target gene. TRAF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF6 BINDING SITE, designated SEQ ID:10970, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77616] Another function of VGAM2269 is therefore inhibition of TNF Receptor-associated Factor 6 (TRAF6, Accession NM_004620). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF6. VPS39 (Accession XM_031720) is another VGAM2269 host target gene. VPS39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS39 BINDING SITE, designated SEQ ID:31474, to the nucleotide sequence of VGAM2269 RNA,

herein designated VGAM RNA, also designated SEQ ID:4980.

[77617] Another function of VGAM2269 is therefore inhibition of VPS39 (Accession XM_031720). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS39. WIT-1 (Accession NM_015855) is another VGAM2269 host target gene. WIT-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WIT-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WIT-1 BINDING SITE, designated SEQ ID:17992, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77618] Another function of VGAM2269 is therefore inhibition of WIT-1 (Accession NM_015855). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WIT-1. LOC129607 (Accession XM_059368) is another VGAM2269 host target gene. LOC129607 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC129607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129607 BINDING SITE, designated SEQ ID:36976, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77619] Another function of VGAM2269 is therefore inhibition of LOC129607 (Accession XM_059368). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129607. LOC144308 (Accession XM_096575) is another VGAM2269 host target gene. LOC144308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:40409, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77620] Another function of VGAM2269 is therefore inhibition of LOC144308 (Accession XM_096575). Accordingly, utilities

of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144308. LOC145761 (Accession XM_096855) is another VGAM2269 host target gene. LOC145761 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145761 BINDING SITE, designated SEQ ID:40586, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77621] Another function of VGAM2269 is therefore inhibition of LOC145761 (Accession XM_096855). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145761. LOC158310 (Accession XM_098919) is another VGAM2269 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158310 BINDING SITE, designated SEQ ID:41945, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77622] Another function of VGAM2269 is therefore inhibition of LOC158310 (Accession XM_098919). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC199986 (Accession XM_117168) is another VGAM2269 host target gene. LOC199986 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199986 BINDING SITE, designated SEQ ID:43270, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77623] Another function of VGAM2269 is therefore inhibition of LOC199986 (Accession XM_117168). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199986. LOC201952 (Accession XM_117345) is another VGAM2269 host target gene. LOC201952 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201952 BINDING SITE, designated SEQ ID:43396, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77624] Another function of VGAM2269 is therefore inhibition of LOC201952 (Accession XM_117345). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201952. LOC219404 (Accession XM_167909) is another VGAM2269 host target gene. LOC219404 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219404 BINDING SITE, designated SEQ ID:44911, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77625] Another function of VGAM2269 is therefore inhibition of

LOC219404 (Accession XM_167909). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219404. LOC219653 (Accession XM_166093) is another VGAM2269 host target gene. LOC219653 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219653 BINDING SITE, designated SEQ ID:43868, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77626] Another function of VGAM2269 is therefore inhibition of LOC219653 (Accession XM_166093). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219653. LOC221178 (Accession XM_167936) is another VGAM2269 host target gene. LOC221178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC221178 BINDING SITE, designated SEQ ID:44927, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77627] Another function of VGAM2269 is therefore inhibition of LOC221178 (Accession XM_167936). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221178. LOC245812 (Accession XM_168296) is another VGAM2269 host target gene. LOC245812 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC245812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245812 BINDING SITE, designated SEQ ID:45100, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77628] Another function of VGAM2269 is therefore inhibition of LOC245812 (Accession XM_168296). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245812. LOC91660 (Accession XM_039902) is an-

other VGAM2269 host target gene. LOC91660 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91660 BINDING SITE, designated SEQ ID:33208, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77629] Another function of VGAM2269 is therefore inhibition of LOC91660 (Accession XM_039902). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91660. LOC92689 (Accession XM_046663) is another VGAM2269 host target gene. LOC92689 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92689 BINDING SITE, designated SEQ ID:34785, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77630] Another function of VGAM2269 is therefore inhibition of LOC92689 (Accession XM_046663). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92689. LOC92906 (Accession NM_138394) is another VGAM2269 host target gene. LOC92906 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92906 BINDING SITE, designated SEQ ID:28762, to the nucleotide sequence of VGAM2269 RNA, herein designated VGAM RNA, also designated SEQ ID:4980.

[77631] Another function of VGAM2269 is therefore inhibition of LOC92906 (Accession NM_138394). Accordingly, utilities of VGAM2269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2270 (VGAM2270) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[77632] VGAM2270 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2270 was detected is described hereinabove with reference to Figs. 1-8.

[77633] VGAM2270 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2270 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77634] VGAM2270 gene encodes a VGAM2270 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2270 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2270 precursor RNA is designated SEQ ID:2256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2256 is located at position 26539 relative to the genome of Alcelaphine Herpesvirus 1.

[77635] VGAM2270 precursor RNA folds onto itself, forming VGAM2270 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77636] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2270 folded precursor RNA into VGAM2270 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2270 RNA is designated SEQ ID:4981, and is provided hereinbelow with reference to the sequence listing part.

[77637] VGAM2270 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2270 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77638] VGAM2270 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2270 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2270 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77639] The complementary binding of VGAM2270 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2270 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2270 host target RNA into VGAM2270 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77640] It is appreciated that VGAM2270 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2270 host target genes. The mRNA of each one of this plurality of VGAM2270 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2270 RNA, herein designated VGAM RNA, and which when bound by VGAM2270 RNA causes inhibition of translation of respective one or more VGAM2270 host target proteins.

[77641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2270 gene, herein designated VGAM GENE, on one or more VGAM2270 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77642] It is yet further appreciated that a function of VGAM2270 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2270 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2270 correlate with, and may be deduced from, the identity of the host target genes which VGAM2270 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[77643] Nucleotide sequences of the VGAM2270 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2270 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2270 are further described hereinbelow with reference to Table 1.

[77644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2270 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2270 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77645] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2270 gene, herein designated VGAM is inhibition of expression of VGAM2270 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2270 correlate with, and may be deduced from, the identity of the target genes which VGAM2270 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77646] HEF1 (Accession NM_006403) is a VGAM2270 host target gene. HEF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEF1 BINDING SITE, designated SEQ ID:13110, to the nucleotide sequence of VGAM2270 RNA, herein designated VGAM RNA, also designated SEQ ID:4981.

[77647] A function of VGAM2270 is therefore inhibition of HEF1 (Accession NM_006403). Accordingly, utilities of VGAM2270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEF1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2271 (VGAM2271) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77648] VGAM2271 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2271 was detected is described hereinabove with reference to Figs. 1-8.

[77649] VGAM2271 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77650] VGAM2271 gene encodes a VGAM2271 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2271 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2271 precursor RNA is designated SEQ ID:2257, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2257 is located at position 29858 relative to the genome of Alcelaphine Herpesvirus 1.

[77651] VGAM2271 precursor RNA folds onto itself, forming VGAM2271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[77652] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2271 folded precursor RNA into VGAM2271 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2271 RNA is designated SEQ ID:4982, and is provided hereinbelow with reference to the sequence listing part.

[77653] VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2271 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77654] VGAM2271 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2271 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2271 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2271 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77655] The complementary binding of VGAM2271 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2271 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2271 host target RNA into VGAM2271 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77656] It is appreciated that VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2271 host target genes. The mRNA of each one of this plurality of VGAM2271 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2271 RNA, herein designated VGAM RNA, and which when bound by VGAM2271 RNA causes inhibition of translation of respective one or more VGAM2271 host target proteins.

[77657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2271 gene, herein designated VGAM GENE, on one or more VGAM2271 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77658] It is yet further appreciated that a function of VGAM2271 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2271 correlate with, and may be deduced from, the identity of the host target genes which VGAM2271 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77659] Nucleotide sequences of the VGAM2271 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2271 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2271 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2271 are further described hereinbelow with reference to Table 1.

[77660] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2271 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2271 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77661] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2271 gene, herein designated VGAM is inhibition of expression of VGAM2271 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2271 correlate with, and may be deduced from, the identity of the target genes which VGAM2271 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77662] Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944) is a VGAM2271 host target gene. PPP3CA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP3CA, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CA BINDING SITE, designated SEQ ID:6642, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77663] A function of VGAM2271 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944), a gene which is the catalytic subunit of calcium-dependent, calmodulin-stimulated protein phosphatase. Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CA. The function of PPP3CA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497.Ceramide Kinase (cerk, Accession NM_022766) is another VGAM2271 host target gene. cerk BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by cerk, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of cerk BINDING

SITE, designated SEQ ID:23012, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77664] Another function of VGAM2271 is therefore inhibition of Ceramide Kinase (cerk, Accession NM_022766). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with cerk. DKFZP434P0111 (Accession XM_041116) is another VGAM2271 host target gene. DKFZP434P0111 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:33453, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77665] Another function of VGAM2271 is therefore inhibition of DKFZP434P0111 (Accession XM_041116). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. FLJ11004 (Accession NM_018296)

is another VGAM2271 host target gene. FLJ11004 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11004 BINDING SITE, designated SEQ ID:20286, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77666] Another function of VGAM2271 is therefore inhibition of FLJ11004 (Accession NM_018296). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11004. FLJ21276 (Accession NM_024633) is another VGAM2271 host target gene. FLJ21276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:23900, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77667] Another function of VGAM2271 is therefore inhibition of FLJ21276 (Accession NM_024633). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276. IDI2 (Accession NM_033261) is another VGAM2271 host target gene. IDI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDI2 BINDING SITE, designated SEQ ID:27090, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77668] Another function of VGAM2271 is therefore inhibition of IDI2 (Accession NM_033261). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDI2. RAB-R (Accession NM_006076) is another VGAM2271 host target gene. RAB-R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB-R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RAB-R BINDING SITE, designated SEQ ID:12720, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77669] Another function of VGAM2271 is therefore inhibition of RAB-R (Accession NM_006076). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB-R. LOC165693 (Accession XM_093373) is another VGAM2271 host target gene. LOC165693 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC165693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165693 BINDING SITE, designated SEQ ID:40186, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77670] Another function of VGAM2271 is therefore inhibition of LOC165693 (Accession XM_093373). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC165693. LOC255042 (Accession XM_170896) is another VGAM2271 host target gene. LOC255042 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255042 BINDING SITE, designated SEQ ID:45649, to the nucleotide sequence of VGAM2271 RNA, herein designated VGAM RNA, also designated SEQ ID:4982.

[77671] Another function of VGAM2271 is therefore inhibition of LOC255042 (Accession XM_170896). Accordingly, utilities of VGAM2271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255042. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2272 (VGAM2272) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77672] VGAM2272 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2272 was detected is described hereinabove with reference to Figs. 1-8.

[77673] VGAM2272 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77674] VGAM2272 gene encodes a VGAM2272 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2272 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2272 precursor RNA is designated SEQ ID:2258, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2258 is located at position 18433 relative to the genome of Alcelaphine Herpesvirus 1.

[77675] VGAM2272 precursor RNA folds onto itself, forming VGAM2272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77676] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2272 folded precursor RNA into VGAM2272 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2272 RNA is designated SEQ ID:4983, and is provided hereinbelow with reference to the sequence listing part.

[77677] VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2272 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77678] VGAM2272 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2272 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2272 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77679] The complementary binding of VGAM2272 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2272 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2272 host target RNA into VGAM2272 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77680] It is appreciated that VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2272 host target genes. The mRNA of each one of this plurality of VGAM2272 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2272 RNA, herein designated VGAM RNA, and which when bound by VGAM2272 RNA causes inhibition of translation of respective one or more VGAM2272 host target proteins.

[77681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2272 gene, herein designated VGAM GENE, on one or more VGAM2272 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77682] It is yet further appreciated that a function of VGAM2272 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2272 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2272 correlate with, and may be deduced from, the identity of the host target genes which VGAM2272 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77683] Nucleotide sequences of the VGAM2272 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2272 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2272 are further described hereinbelow with reference to Table 1.

[77684] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2272 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2272 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77685] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2272 gene, herein designated VGAM is inhibition of expression of VGAM2272 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2272 correlate with, and may be deduced from, the identity of the target genes which VGAM2272 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77686] Formyl Peptide Receptor-like 1 (FPRL1, Accession NM_001462) is a VGAM2272 host target gene. FPRL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FPRL1 BINDING SITE, designated SEQ ID:7195, to the nucleotide sequence of VGAM2272 RNA, herein designated VGAM RNA, also designated SEQ ID:4983.

[77687] A function of VGAM2272 is therefore inhibition of Formyl Peptide Receptor-like 1 (FPRL1, Accession NM_001462). Accordingly, utilities of VGAM2272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPRL1. LIM Domain Kinase 1 (LIMK1, Accession NM_016735) is another VGAM2272 host target gene. LIMK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIMK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE, designated SEQ ID:18800, to the nucleotide sequence of VGAM2272 RNA, herein designated VGAM RNA, also designated SEQ ID:4983.

[77688] Another function of VGAM2272 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_016735). Ac-

cordingly, utilities of VGAM2272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM_021960) is another VGAM2272 host target gene. MCL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:22486, to the nucleotide sequence of VGAM2272 RNA, herein designated VGAM RNA, also designated SEQ ID:4983.

[77689] Another function of VGAM2272 is therefore inhibition of Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM_021960), a gene which involved in programing of differentiation and concomitant maintenance of viability. Accordingly, utilities of VGAM2272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1. The function of MCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1083.Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_016348) is another VGAM2272 host target gene. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C5orf4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:18472 and SEQ ID:26177 respectively, to the nucleotide sequence of VGAM2272 RNA, herein designated VGAM RNA, also designated SEQ ID:4983.

[77690] Another function of VGAM2272 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_016348). Accordingly, utilities of VGAM2272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. DKFZP434C128 (Accession XM_036086) is another VGAM2273 host target gene. DKFZP434C128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DKFZP434C128 BINDING SITE, designated SEQ ID:32374, to the nucleotide sequence of VGAM2273 RNA, herein designated VGAM RNA, also designated SEQ ID:4984.

[77691] Another function of VGAM2273 is therefore inhibition of DKFZP434C128 (Accession XM_036086). Accordingly, utilities of VGAM2273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C128. IMP-2 (Accession NM_006548) is another VGAM2273 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:13302, to the nucleotide sequence of VGAM2273 RNA, herein designated VGAM RNA, also designated SEQ ID:4984.

[77692] Another function of VGAM2273 is therefore inhibition of IMP-2 (Accession NM_006548). Accordingly, utilities of VGAM2273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is

another VGAM2273 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45764, to the nucleotide sequence of VGAM2273 RNA, herein designated VGAM RNA, also designated SEQ ID:4984.

[77693] Another function of VGAM2273 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM2273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. LOC147671 (Accession XM_085844) is another VGAM2273 host target gene. LOC147671 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147671 BINDING SITE, designated SEQ ID:38376, to the nucleotide sequence of VGAM2273 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4984.

[77694] Another function of VGAM2273 is therefore inhibition of LOC147671 (Accession XM_085844). Accordingly, utilities of VGAM2273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147671. LOC158819 (Accession XM_098995) is another VGAM2273 host target gene. LOC158819 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158819 BINDING SITE, designated SEQ ID:42024, to the nucleotide sequence of VGAM2273 RNA, herein designated VGAM RNA, also designated SEQ ID:4984.

[77695] Another function of VGAM2273 is therefore inhibition of LOC158819 (Accession XM_098995). Accordingly, utilities of VGAM2273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158819. LOC200014 (Accession XM_114087) is another VGAM2273 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200014, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42693, to the nucleotide sequence of VGAM2273 RNA, herein designated VGAM RNA, also designated SEQ ID:4984.

[77696] Another function of VGAM2273 is therefore inhibition of LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM2273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2274 (VGAM2274) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77697] VGAM2274 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2274 was detected is described hereinabove with reference to Figs. 1-8.

[77698] VGAM2274 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus

1. VGAM2274 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77699] VGAM2274 gene encodes a VGAM2274 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2274 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2274 precursor RNA is designated SEQ ID:2260, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2260 is located at position 31577 relative to the genome of Alcelaphine Herpesvirus 1.

[77700] VGAM2274 precursor RNA folds onto itself, forming VGAM2274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77701] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2274 folded precursor RNA into VGAM2274 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2274 RNA is designated SEQ ID:4985, and is provided hereinbelow with reference to the sequence listing part.

[77702] VGAM2274 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2274 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77703] VGAM2274 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2274 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2274 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77704] The complementary binding of VGAM2274 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2274 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2274 host target RNA into VGAM2274 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77705] It is appreciated that VGAM2274 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2274 host target genes. The mRNA of each one of this plurality of VGAM2274 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2274 RNA, herein designated VGAM RNA, and which when bound by VGAM2274 RNA causes inhibition of translation of respective one or more VGAM2274 host target proteins.

[77706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2274 gene, herein designated VGAM GENE, on one or more VGAM2274 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77707] It is yet further appreciated that a function of VGAM2274 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2274 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2274 correlate with, and may be deduced from, the identity of the host target genes which VGAM2274 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77708] Nucleotide sequences of the VGAM2274 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2274 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2274 are further described hereinbelow with reference to Table 1.

[77709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2274 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2274 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77710] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2274 gene, herein designated VGAM is inhibition of expression of VGAM2274 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2274 correlate with, and may be deduced from, the identity of the target genes which VGAM2274 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77711] Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, S. cerevisiae) (ATRX, Accession NM_000489) is a VGAM2274 host target gene. ATRX BINDING SITE1 and ATRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of ATRX BINDING SITE1 and ATRX BINDING SITE2, designated SEQ ID:6094 and SEQ ID:28683 respectively, to the nucleotide sequence of VGAM2274 RNA, herein designated VGAM RNA, also designated SEQ ID:4985.

[77712] A function of VGAM2274 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, S. cerevisiae) (ATRX, Accession NM_000489). Accordingly, utilities of VGAM2274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. KIAA1102 (Accession XM_044461) is another VGAM2274 host target gene. KIAA1102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1102 BINDING SITE, designated SEQ ID:34211, to the nucleotide sequence of VGAM2274 RNA, herein designated VGAM RNA, also designated SEQ ID:4985.

[77713] Another function of VGAM2274 is therefore inhibition of KIAA1102 (Accession XM_044461). Accordingly, utilities

of VGAM2274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1102. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2275 (VGAM2275) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77714] VGAM2275 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2275 was detected is described hereinabove with reference to Figs. 1-8.

[77715] VGAM2275 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77716] VGAM2275 gene encodes a VGAM2275 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2275 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2275 precursor RNA is designated SEQ ID:2261, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2261 is located at position 30158 relative to the genome of Alcelaphine Herpesvirus 1.

[77717] VGAM2275 precursor RNA folds onto itself, forming VGAM2275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77718] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2275 folded precursor RNA into VGAM2275 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2275 RNA is designated SEQ ID:4986, and

is provided hereinbelow with reference to the sequence listing part.

[77719] VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2275 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77720] VGAM2275 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2275 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2275 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77721] The complementary binding of VGAM2275 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2275 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2275 host target RNA into VGAM2275 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77722] It is appreciated that VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2275 host target genes. The mRNA of each one of this plurality of VGAM2275 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2275 RNA, herein designated VGAM RNA, and which when bound by VGAM2275 RNA causes inhibition of translation of respective one or more VGAM2275 host target proteins.

[77723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2275 gene, herein designated VGAM GENE, on one or more VGAM2275 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77724] It is yet further appreciated that a function of VGAM2275 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2275 correlate with, and may be deduced from, the identity of the host target genes which VGAM2275 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77725] Nucleotide sequences of the VGAM2275 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2275 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2275 are further described hereinbelow with reference to Table 1.

[77726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2275 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2275 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77727] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2275 gene, herein designated VGAM is inhibition of expression of VGAM2275 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2275 correlate with, and may be deduced from, the identity of the target genes which VGAM2275 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77728] Collagen, Type VI, Alpha 2 (COL6A2, Accession NM_058175) is a VGAM2275 host target gene. COL6A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL6A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL6A2 BINDING SITE, designated SEQ ID:27726, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77729] A function of VGAM2275 is therefore inhibition of Collagen, Type VI, Alpha 2 (COL6A2, Accession NM_058175). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL6A2. DKFZP434H132 (Accession

XM_057020) is another VGAM2275 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36445, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77730] Another function of VGAM2275 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. DKFZP586I2223 (Accession NM_080730) is another VGAM2275 host target gene. DKFZP586I2223 BINDING SITE1 through DKFZP586I2223 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP586I2223, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE1

through DKFZP586I2223 BINDING SITE3, designated SEQ ID:28017, SEQ ID:28019 and SEQ ID:17730 respectively, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77731] Another function of VGAM2275 is therefore inhibition of DKFZP586I2223 (Accession NM_080730). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223. FLJ00007 (Accession XM_048928) is another VGAM2275 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35310, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77732] Another function of VGAM2275 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ23231 (Accession NM_025079) is another

VGAM2275 host target gene. FLJ23231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23231 BINDING SITE, designated SEQ ID:24679, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77733] Another function of VGAM2275 is therefore inhibition of FLJ23231 (Accession NM_025079). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23231. MIG2 (Accession XM_051693) is another VGAM2275 host target gene. MIG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG2 BINDING SITE, designated SEQ ID:35863, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77734] Another function of VGAM2275 is therefore inhibition of MIG2 (Accession XM_051693). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG2. PRO0650 (Accession NM_014137) is another VGAM2275 host target gene. PRO0650 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0650 BINDING SITE, designated SEQ ID:15403, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77735] Another function of VGAM2275 is therefore inhibition of PRO0650 (Accession NM_014137). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0650. LOC165140 (Accession XM_092406) is another VGAM2275 host target gene. LOC165140 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC165140, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165140 BINDING SITE, designated SEQ ID:40117, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77736] Another function of VGAM2275 is therefore inhibition of LOC165140 (Accession XM_092406). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165140. LOC197414 (Accession XM_113880) is another VGAM2275 host target gene. LOC197414 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197414 BINDING SITE, designated SEQ ID:42514, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77737] Another function of VGAM2275 is therefore inhibition of LOC197414 (Accession XM_113880). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC197414. LOC199923 (Accession XM_114057) is another VGAM2275 host target gene. LOC199923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199923 BINDING SITE, designated SEQ ID:42669, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77738] Another function of VGAM2275 is therefore inhibition of LOC199923 (Accession XM_114057). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199923. LOC222160 (Accession XM_168431) is another VGAM2275 host target gene. LOC222160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222160 BINDING SITE, designated SEQ ID:45167, to the nucleotide sequence of VGAM2275 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4986.

[77739] Another function of VGAM2275 is therefore inhibition of LOC222160 (Accession XM_168431). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222160. LOC255645 (Accession XM_172967) is another VGAM2275 host target gene. LOC255645 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255645 BINDING SITE, designated SEQ ID:46221, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77740] Another function of VGAM2275 is therefore inhibition of LOC255645 (Accession XM_172967). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255645. LOC90092 (Accession XM_028862) is another VGAM2275 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90092, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30787, to the nucleotide sequence of VGAM2275 RNA, herein designated VGAM RNA, also designated SEQ ID:4986.

[77741] Another function of VGAM2275 is therefore inhibition of LOC90092 (Accession XM_028862). Accordingly, utilities of VGAM2275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2276 (VGAM2276) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77742] VGAM2276 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2276 was detected is described hereinabove with reference to Figs. 1-8.

[77743] VGAM2276 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus

1. VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77744] VGAM2276 gene encodes a VGAM2276 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2276 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2276 precursor RNA is designated SEQ ID:2262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2262 is located at position 30027 relative to the genome of Alcelaphine Herpesvirus 1.

[77745] VGAM2276 precursor RNA folds onto itself, forming VGAM2276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77746] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2276 folded precursor RNA into VGAM2276 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2276 RNA is designated SEQ ID:4987, and is provided hereinbelow with reference to the sequence listing part.

[77747] VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2276 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77748] VGAM2276 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2276 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77749] The complementary binding of VGAM2276 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2276 host target RNA into VGAM2276 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77750] It is appreciated that VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2276 host target genes. The mRNA of each one of this plurality of VGAM2276 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2276 RNA, herein designated VGAM RNA, and which when bound by VGAM2276 RNA causes inhibition of translation of respective one or more VGAM2276 host target proteins.

[77751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2276 gene, herein designated VGAM GENE, on one or more VGAM2276 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77752] It is yet further appreciated that a function of VGAM2276 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2276 correlate with, and may be deduced from, the identity of the host target genes which VGAM2276 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77753] Nucleotide sequences of the VGAM2276 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2276 are further described hereinbelow with reference to Table 1.

[77754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2276 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77755] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2276 gene, herein designated VGAM is inhibition of expression of VGAM2276 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2276 correlate with, and may be deduced from, the identity of the target genes which VGAM2276 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77756] Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM_054027) is a VGAM2276 host target gene. ANKH BINDING SITE1 and ANKH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANKH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKH BINDING SITE1 and ANKH

BINDING SITE2, designated SEQ ID:27635 and SEQ ID:21252 respectively, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77757] A function of VGAM2276 is therefore inhibition of Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM_054027), a gene which regulates intra- and extracellular levels of inorganic pyrophosphate (ppi), probably functioning as ppi transporter. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKH. The function of ANKH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1247.Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007336) is another VGAM2276 host target gene. DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLEC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2, desig-

nated SEQ ID:14264 and SEQ ID:14271 respectively, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77758] Another function of VGAM2276 is therefore inhibition of Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007336). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEC1. LENG4 (Accession NM_024298) is another VGAM2276 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23586, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77759] Another function of VGAM2276 is therefore inhibition of LENG4 (Accession NM_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4.

The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.Lipoprotein Lipase (LPL, Accession NM_000237) is another VGAM2276 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5753, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77760] Another function of VGAM2276 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the enzyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM55.Mannosidase, Alpha, Class 2C, Member 1 (MAN2C1, Accession XM_053585) is another VGAM2276 host target gene. MAN2C1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAN2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2C1 BINDING SITE, designated SEQ ID:36102, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77761] Another function of VGAM2276 is therefore inhibition of Mannosidase, Alpha, Class 2C, Member 1 (MAN2C1, Accession XM_053585), a gene which is Strongly similar to a region of rat ER alpha-mannosidase. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2C1. The function of MAN2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM958.Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Acces-

sion XM_008355) is another VGAM2276 host target gene. MPP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MPP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:30082, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77762] Another function of VGAM2276 is therefore inhibition of Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2. poly(A) Binding Protein, Cytoplasmic 1 (PABPC1, Accession NM_002568) is another VGAM2276 host target gene. PABPC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PABPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPC1 BINDING SITE, designated SEQ ID:8419, to the nucleotide sequence of

VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77763] Another function of VGAM2276 is therefore inhibition of poly(A) Binding Protein, Cytoplasmic 1 (PABPC1, Accession NM_002568), a gene which involves in cytoplasmic regulatory processes of mRNA metabolism. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPC1. The function of PABPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280.Solute Carrier Family 13 (sodium-dependent dicarboxylate transporter), Member 3 (SLC13A3, Accession XM_017841) is another VGAM2276 host target gene. SLC13A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC13A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC13A3 BINDING SITE, designated SEQ ID:30329, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77764] Another function of VGAM2276 is therefore inhibition of Solute Carrier Family 13 (sodium-dependent dicarboxylate transporter), Member 3 (SLC13A3, Accession XM_017841). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC13A3. Steroidogenic Acute Regulatory Protein (STAR, Accession NM_000349) is another VGAM2276 host target gene. STAR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAR BINDING SITE, designated SEQ ID:5904, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77765] Another function of VGAM2276 is therefore inhibition of Steroidogenic Acute Regulatory Protein (STAR, Accession NM_000349). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAR. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169) is another VGAM2276 host target gene. SUFU BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18258, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77766] Another function of VGAM2276 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. Testis Enhanced Gene Transcript (BAX inhibitor 1) (TEGT, Accession XM_035490) is another VGAM2276 host target gene. TEGT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEGT BINDING SITE, designated SEQ ID:32275, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77767] Another function of VGAM2276 is therefore inhibition of Testis Enhanced Gene Transcript (BAX inhibitor 1) (TEGT, Accession XM_035490), a gene which is a suppressor of apoptosis. Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEGT. The function of TEGT has been established by previous studies. Walter et al. (1994) identified a single-copy gene in the rat for which 2 transcripts were found in each organ tested. The shorter transcript of about 1 kb was highly abundant in the postpubertal testis. The gene was therefore designated Tegt (for testis enhanced gene transcript). Using a rat Tegt probe, Walter et al. (1995) screened a human testis cDNA library and isolated the human homolog of the rat Tegt gene. The gene in the rat and humans does not belong to any known gene family of vertebrates. The deduced amino acid sequence of the gene and a bacterial protein of unknown function show low but significant homology and very similar hydrophobicity profiles. The 2 different transcripts are due to alternative usage of 2 polyadenylation sites. The presence of a nuclear targeting motif indicates that the gene product must localize to the nucleus. By Southern blot analysis of DNA from rat/human somatic

cell hybrids, Walter et al. (1995) mapped the TEGT gene to human chromosome 12. Fluorescence in situ hybridization refined the assignment to 12q12-q13. This localization agrees with the assignment of the gene to rat chromosome 7 and to mouse chromosome 15. The mammalian proapoptotic protein BAX (OMIM Ref. No. 600040) confers a lethal phenotype when expressed in yeast. By exploiting this phenotype, Xu and Reed (1998) identified a human BAX inhibitor, BI1. BI1 is an evolutionarily conserved integral membrane protein containing 6 predicted membrane-spanning segments and is predominantly localized to intracellular membranes, similar to BCL2 family proteins. The predicted protein contains 237 amino acids and is identical to TEGT. BI1 can interact with BCL2 (OMIM Ref. No. 151430) and BCLX(L) but not BAX or BAK, as demonstrated by in vivo crosslinking and coimmunoprecipitation studies. When overexpressed in mammalian cells, BI1 suppressed apoptosis induced by BAX, etoposide, staurosporine, and growth factor deprivation, but not by FAS (CD95). Conversely, BI1 antisense induced apoptosis. BI1 thus represents a regulator of cell death pathways controlled by BCL2 and BAX.

[77768] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[77769] Walter, L.; Marynen, P.; Szpirer, J.; Levan, G.; Gunther, E. : Identification of a novel conserved human gene, TEGT. Genomics 28: 301-304, 1995. ; and

[77770] Xu, Q.; Reed, J. C. : Bax inhibitor-1, a mammalian apoptosis suppressor identified by functional screening in yeast. Molec. Cell 1: 337-346, 1998.

[77771] Further studies establishing the function and utilities of TEGT are found in John Hopkins OMIM database record ID 600748, and in sited publications numbered 7568-7570 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DKFZp434K2435 (Accession NM_032256) is another VGAM2276 host target gene. DKFZp434K2435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434K2435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434K2435 BINDING SITE, designated SEQ ID:26000, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77772] Another function of VGAM2276 is therefore inhibition of DKFZp434K2435 (Accession NM_032256). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K2435. DKFZp547E052 (Accession NM_032276) is another VGAM2276 host target gene. DKFZp547E052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547E052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547E052 BINDING SITE, designated SEQ ID:26031, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77773] Another function of VGAM2276 is therefore inhibition of DKFZp547E052 (Accession NM_032276). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547E052. FLJ12287 (Accession NM_022367) is another VGAM2276 host target gene. FLJ12287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12287, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12287 BINDING SITE, designated SEQ ID:22755, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77774] Another function of VGAM2276 is therefore inhibition of FLJ12287 (Accession NM_022367). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12287. FLJ13162 (Accession NM_025002) is another VGAM2276 host target gene. FLJ13162 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13162 BINDING SITE, designated SEQ ID:24573, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77775] Another function of VGAM2276 is therefore inhibition of FLJ13162 (Accession NM_025002). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13162. FLJ14743 (Accession XM_042708) is another VGAM2276 host target gene. FLJ14743 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14743 BINDING SITE, designated SEQ ID:33761, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77776] Another function of VGAM2276 is therefore inhibition of FLJ14743 (Accession XM_042708). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14743. FLJ20739 (Accession XM_042197) is another VGAM2276 host target gene. FLJ20739 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20739 BINDING SITE, designated SEQ ID:33703, to the nucleotide

sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77777] Another function of VGAM2276 is therefore inhibition of FLJ20739 (Accession XM_042197). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20739. KIAA0082 (Accession XM_166400) is another VGAM2276 host target gene. KIAA0082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0082 BINDING SITE, designated SEQ ID:44264, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77778] Another function of VGAM2276 is therefore inhibition of KIAA0082 (Accession XM_166400). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0082. KIAA0494 (Accession NM_014774) is another VGAM2276 host target gene. KIAA0494 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16588, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77779] Another function of VGAM2276 is therefore inhibition of KIAA0494 (Accession NM_014774). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. KIAA0872 (Accession NM_014940) is another VGAM2276 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17248, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77780] Another function of VGAM2276 is therefore inhibition of KIAA0872 (Accession NM_014940). Accordingly, utilities

of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. KIAA1344 (Accession XM_051699) is another VGAM2276 host target gene. KIAA1344 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1344 BINDING SITE, designated SEQ ID:35873, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77781] Another function of VGAM2276 is therefore inhibition of KIAA1344 (Accession XM_051699). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1344. KIAA1416 (Accession XM_098762) is another VGAM2276 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1416 BINDING SITE, designated SEQ ID:41804, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77782] Another function of VGAM2276 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. KIAA1821 (Accession XM_050101) is another VGAM2276 host target gene. KIAA1821 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1821 BINDING SITE, designated SEQ ID:35554, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77783] Another function of VGAM2276 is therefore inhibition of KIAA1821 (Accession XM_050101). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1821. KIAA1870 (Accession NM_032888) is another VGAM2276 host target gene. KIAA1870 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1870 BINDING SITE, designated SEQ ID:26712, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77784] Another function of VGAM2276 is therefore inhibition of KIAA1870 (Accession NM_032888). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1870. MGC10334 (Accession NM_030575) is another VGAM2276 host target gene. MGC10334 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10334 BINDING SITE, designated SEQ ID:24949, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77785] Another function of VGAM2276 is therefore inhibition of

MGC10334 (Accession NM_030575). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10334. Paralemmin (PALM, Accession NM_002579) is another VGAM2276 host target gene. PALM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PALM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PALM BINDING SITE, designated SEQ ID:8438, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77786] Another function of VGAM2276 is therefore inhibition of Paralemmin (PALM, Accession NM_002579). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PALM. Placenta-specific 3 (PLAC3, Accession XM_045115) is another VGAM2276 host target gene. PLAC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:34365, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77787] Another function of VGAM2276 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM_045115). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. PRO2015 (Accession NM_018512) is another VGAM2276 host target gene. PRO2015 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2015 BINDING SITE, designated SEQ ID:20586, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77788] Another function of VGAM2276 is therefore inhibition of PRO2015 (Accession NM_018512). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PRO2015. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065) is another VGAM2276 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:12711, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77789] Another function of VGAM2276 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. TU3A (Accession NM_007177) is another VGAM2276 host target gene. TU3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TU3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU3A BINDING SITE, designated SEQ ID:14036,

to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77790] Another function of VGAM2276 is therefore inhibition of TU3A (Accession NM_007177). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A. ZFP100 (Accession XM_046390) is another VGAM2276 host target gene. ZFP100 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP100 BINDING SITE, designated SEQ ID:34707, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77791] Another function of VGAM2276 is therefore inhibition of ZFP100 (Accession XM_046390). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP100. LOC129642 (Accession NM_138799) is another VGAM2276 host target gene. LOC129642 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC129642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129642 BINDING SITE, designated SEQ ID:29021, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77792] Another function of VGAM2276 is therefore inhibition of LOC129642 (Accession NM_138799). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129642. LOC143666 (Accession XM_096465) is another VGAM2276 host target gene. LOC143666 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143666 BINDING SITE, designated SEQ ID:40371, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77793] Another function of VGAM2276 is therefore inhibition of LOC143666 (Accession XM_096465). Accordingly, utilities

of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143666. LOC147229 (Accession XM_085742) is another VGAM2276 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:38322, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77794] Another function of VGAM2276 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147229. LOC150319 (Accession XM_086816) is another VGAM2276 host target gene. LOC150319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150319 BINDING SITE, designated SEQ ID:38892, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77795] Another function of VGAM2276 is therefore inhibition of LOC150319 (Accession XM_086816). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150319. LOC157918 (Accession XM_098842) is another VGAM2276 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41895, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77796] Another function of VGAM2276 is therefore inhibition of LOC157918 (Accession XM_098842). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC157919 (Accession XM_088420) is another VGAM2276 host target gene. LOC157919 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157919 BINDING SITE, designated SEQ ID:39682, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77797] Another function of VGAM2276 is therefore inhibition of LOC157919 (Accession XM_088420). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157919. LOC200197 (Accession XM_114148) is another VGAM2276 host target gene. LOC200197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200197 BINDING SITE, designated SEQ ID:42731, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77798] Another function of VGAM2276 is therefore inhibition of

LOC200197 (Accession XM_114148). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200197. LOC200583 (Accession XM_114265) is another VGAM2276 host target gene. LOC200583 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200583 BINDING SITE, designated SEQ ID:42822, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77799] Another function of VGAM2276 is therefore inhibition of LOC200583 (Accession XM_114265). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200583. LOC202052 (Accession XM_117355) is another VGAM2276 host target gene. LOC202052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC202052 BINDING SITE, designated SEQ ID:43409, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77800] Another function of VGAM2276 is therefore inhibition of LOC202052 (Accession XM_117355). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202052. LOC220827 (Accession XM_166052) is another VGAM2276 host target gene. LOC220827 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220827 BINDING SITE, designated SEQ ID:43844, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77801] Another function of VGAM2276 is therefore inhibition of LOC220827 (Accession XM_166052). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220827. LOC222008 (Accession XM_168361) is an-

other VGAM2276 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:45126, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77802] Another function of VGAM2276 is therefore inhibition of LOC222008 (Accession XM_168361). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222008. LOC92017 (Accession XM_042234) is another VGAM2276 host target gene. LOC92017 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92017 BINDING SITE, designated SEQ ID:33710, to the nucleotide sequence of VGAM2276 RNA, herein designated VGAM RNA, also designated SEQ ID:4987.

[77803] Another function of VGAM2276 is therefore inhibition of LOC92017 (Accession XM_042234). Accordingly, utilities of VGAM2276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2277 (VGAM2277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77804] VGAM2277 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2277 was detected is described hereinabove with reference to Figs. 1-8.

[77805] VGAM2277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77806] VGAM2277 gene encodes a VGAM2277 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2277 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2277 precursor RNA is designated SEQ ID:2263, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2263 is located at position 27286 relative to the genome of Alcelaphine Herpesvirus 1.

[77807] VGAM2277 precursor RNA folds onto itself, forming VGAM2277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77808] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2277 folded precursor RNA into VGAM2277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2277 RNA is designated SEQ ID:4988, and is provided hereinbelow with reference to the sequence listing part.

[77809] VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2277 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77810] VGAM2277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2277 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2277 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77811] The complementary binding of VGAM2277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2277 host target RNA into VGAM2277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77812] It is appreciated that VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2277 host target genes. The mRNA of each one of this plurality of VGAM2277 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2277 RNA, herein designated VGAM RNA, and which when bound by VGAM2277 RNA causes inhibition of translation of respective one or more VGAM2277 host target proteins.

[77813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2277 gene, herein designated VGAM GENE, on one or more VGAM2277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77814] It is yet further appreciated that a function of VGAM2277 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2277 correlate with, and may be deduced from, the identity of the host target genes which VGAM2277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77815] Nucleotide sequences of the VGAM2277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2277 are further described hereinbelow with reference to Table 1.

[77816] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2277 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2277 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[77817] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2277 gene, herein designated VGAM is inhibition of expression of VGAM2277 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2277 correlate with, and may be deduced from, the identity of the target genes which VGAM2277 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77818] ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916) is a VGAM2277 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44920, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77819] A function of VGAM2277 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916). Accordingly,

utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM_030806) is another VGAM2277 host target gene. FLNB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLNB BINDING SITE, designated SEQ ID:31138, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77820] Another function of VGAM2277 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM_030806), a gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNB. The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM416.Myxovirus (influenza

virus) Resistance 2 (mouse) (MX2, Accession NM_002463) is another VGAM2277 host target gene. MX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MX2 BINDING SITE, designated SEQ ID:8294, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77821] Another function of VGAM2277 is therefore inhibition of Myxovirus (influenza virus) Resistance 2 (mouse) (MX2, Accession NM_002463). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MX2. PAG (Accession NM_018440) is another VGAM2277 host target gene. PAG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAG BINDING SITE, designated SEQ ID:20511, to the nucleotide sequence of VGAM2277 RNA,

herein designated VGAM RNA, also designated SEQ ID:4988.

[77822] Another function of VGAM2277 is therefore inhibition of PAG (Accession NM_018440). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAG. Protocadherin 9 (PCDH9, Accession XM_096054) is another VGAM2277 host target gene. PCDH9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH9 BINDING SITE, designated SEQ ID:40293, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77823] Another function of VGAM2277 is therefore inhibition of Protocadherin 9 (PCDH9, Accession XM_096054). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH9. Ribonuclease/angiogenin Inhibitor (RNH, Accession NM_002939) is another VGAM2277 host target gene. RNH BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by RNH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNH BINDING SITE, designated SEQ ID:8843, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77824] Another function of VGAM2277 is therefore inhibition of Ribonuclease/angiogenin Inhibitor (RNH, Accession NM_002939), a gene which is an inhibitor of pancreatic rnase and angiogenin. may also function in the modulation of cellular activities. Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNH. The function of RNH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM484.Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM_001244) is another VGAM2277 host target gene. TNFSF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF8 BINDING SITE, designated SEQ ID:6915, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77825] Another function of VGAM2277 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM_001244), a gene which cytokine that binds to tnfrsf8/cd30. induces proliferation of t cells. Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF8. The function of TNFSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM655.ARP3 Actin-related Protein 3 Homolog (yeast) (ACTR3, Accession NM_005721) is another VGAM2277 host target gene. ACTR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACTR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR3 BINDING SITE, designated SEQ

ID:12273, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77826] Another function of VGAM2277 is therefore inhibition of ARP3 Actin-related Protein 3 Homolog (yeast) (ACTR3, Accession NM_005721). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR3. ERp44 (Accession XM_088476) is another VGAM2277 host target gene. ERp44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERp44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERp44 BINDING SITE, designated SEQ ID:39721, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77827] Another function of VGAM2277 is therefore inhibition of ERp44 (Accession XM_088476). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERp44. FLJ10330 (Accession NM_018061) is another VGAM2277

host target gene. FLJ10330 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10330 BINDING SITE, designated SEQ ID:19832, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77828] Another function of VGAM2277 is therefore inhibition of FLJ10330 (Accession NM_018061). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10330. FLJ10849 (Accession NM_018243) is another VGAM2277 host target gene. FLJ10849 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10849, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10849 BINDING SITE, designated SEQ ID:20203, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77829] Another function of VGAM2277 is therefore inhibition of FLJ10849 (Accession NM_018243). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10849. FLJ23121 (Accession NM_024694) is another VGAM2277 host target gene. FLJ23121 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23121 BINDING SITE, designated SEQ ID:24003, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77830] Another function of VGAM2277 is therefore inhibition of FLJ23121 (Accession NM_024694). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23121. FLJ23519 (Accession NM_032240) is another VGAM2277 host target gene. FLJ23519 BINDING SITE1 and FLJ23519 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ23519, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE1 and FLJ23519 BINDING SITE2, designated SEQ ID:25973 and SEQ ID:34306 respectively, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77831] Another function of VGAM2277 is therefore inhibition of FLJ23519 (Accession NM_032240). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. KIAA1130 (Accession XM_031104) is another VGAM2277 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31279, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77832] Another function of VGAM2277 is therefore inhibition of KIAA1130 (Accession XM_031104). Accordingly, utilities

of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1238 (Accession XM_048675) is another VGAM2277 host target gene. KIAA1238 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1238 BINDING SITE, designated SEQ ID:35216, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77833] Another function of VGAM2277 is therefore inhibition of KIAA1238 (Accession XM_048675). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1238. LAP1B (Accession XM_035429) is another VGAM2277 host target gene. LAP1B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAP1B BINDING SITE,

designated SEQ ID:32262, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77834] Another function of VGAM2277 is therefore inhibition of LAP1B (Accession XM_035429). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAP1B. MGC14289 (Accession NM_080660) is another VGAM2277 host target gene. MGC14289 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14289 BINDING SITE, designated SEQ ID:27947, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77835] Another function of VGAM2277 is therefore inhibition of MGC14289 (Accession NM_080660). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14289. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635) is another

VGAM2277 host target gene. P2RX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX1 BINDING SITE, designated SEQ ID:33351, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77836] Another function of VGAM2277 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX1. SYNCOILIN (Accession NM_030786) is another VGAM2277 host target gene. SYNCOILIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNCOILIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNCOILIN BINDING SITE, designated SEQ ID:25080, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA,

also designated SEQ ID:4988.

[77837] Another function of VGAM2277 is therefore inhibition of SYNCOILIN (Accession NM_030786). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNCOILIN. LOC132880 (Accession XM_059609) is another VGAM2277 host target gene. LOC132880 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132880 BINDING SITE, designated SEQ ID:37030, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77838] Another function of VGAM2277 is therefore inhibition of LOC132880 (Accession XM_059609). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132880. LOC158014 (Accession XM_088442) is another VGAM2277 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158014, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39691, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77839] Another function of VGAM2277 is therefore inhibition of LOC158014 (Accession XM_088442). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC158357 (Accession XM_088553) is another VGAM2277 host target gene. LOC158357 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158357 BINDING SITE, designated SEQ ID:39819, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77840] Another function of VGAM2277 is therefore inhibition of LOC158357 (Accession XM_088553). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158357. LOC162137 (Accession XM_102426) is another VGAM2277 host target gene. LOC162137 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC162137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162137 BINDING SITE, designated SEQ ID:42113, to the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77841] Another function of VGAM2277 is therefore inhibition of LOC162137 (Accession XM_102426). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162137. LOC253596 (Accession XM_170934) is another VGAM2277 host target gene. LOC253596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253596 BINDING SITE, designated SEQ ID:45722, to

the nucleotide sequence of VGAM2277 RNA, herein designated VGAM RNA, also designated SEQ ID:4988.

[77842] Another function of VGAM2277 is therefore inhibition of LOC253596 (Accession XM_170934). Accordingly, utilities of VGAM2277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253596. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2278 (VGAM2278) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77843] VGAM2278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2278 was detected is described hereinabove with reference to Figs. 1-8.

[77844] VGAM2278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77845] VGAM2278 gene encodes a VGAM2278 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2278 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2278 precursor RNA is designated SEQ ID:2264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2264 is located at position 29724 relative to the genome of Alcelaphine Herpesvirus 1.

[77846] VGAM2278 precursor RNA folds onto itself, forming VGAM2278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77847] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2278 folded precursor RNA into VGAM2278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2278 RNA is designated SEQ ID:4989, and is provided hereinbelow with reference to the sequence listing part.

[77848] VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2278 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77849] VGAM2278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2278 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2278 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77850] The complementary binding of VGAM2278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2278 host target RNA into VGAM2278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77851] It is appreciated that VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2278 host target genes. The mRNA of each one of this plurality of VGAM2278 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2278 RNA, herein designated VGAM RNA, and which when bound by VGAM2278 RNA causes inhibition of translation of respective one or more VGAM2278 host target proteins.

[77852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2278 gene, herein designated VGAM GENE, on one or more VGAM2278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77853] It is yet further appreciated that a function of VGAM2278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2278 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2278 correlate with, and may be deduced from, the identity of the host target genes which VGAM2278 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77854] Nucleotide sequences of the VGAM2278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2278 are further described hereinbelow with reference to Table 1.

[77855] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2278 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2278 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77856] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2278 gene, herein designated VGAM is inhibition of expression of VGAM2278 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2278 correlate with, and may be deduced from, the identity of the target genes which VGAM2278 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77857] LOC200339 (Accession XM_117226) is a VGAM2278 host target gene. LOC200339 BINDING SITE1 and LOC200339 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC200339, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE1 and LOC200339 BINDING SITE2, designated SEQ ID:43301 and SEQ ID:43302 respectively, to the nucleotide sequence of VGAM2278 RNA, herein designated VGAM RNA, also designated SEQ ID:4989.

[77858] A function of VGAM2278 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM2278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2279 (VGAM2279) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77859] VGAM2279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2279 was detected is described hereinabove with reference to Figs. 1-8.

[77860] VGAM2279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77861] VGAM2279 gene encodes a VGAM2279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2279 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2279 precursor RNA is designated SEQ ID:2265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2265 is located at position 26039 relative to the genome of Alcelaphine Herpesvirus 1.

[77862] VGAM2279 precursor RNA folds onto itself, forming VGAM2279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77863] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2279 folded precursor RNA into VGAM2279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2279 RNA is designated SEQ ID:4990, and is provided hereinbelow with reference to the sequence listing part.

[77864] VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2279 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77865] VGAM2279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2279 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2279 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77866] The complementary binding of VGAM2279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2279 host target RNA into VGAM2279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77867] It is appreciated that VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2279 host target genes. The mRNA of each one of this plurality of VGAM2279 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2279 RNA, herein designated VGAM RNA, and which when bound by VGAM2279 RNA causes inhibition of translation of respective one or more VGAM2279 host target proteins.

[77868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2279 gene, herein designated VGAM GENE, on one or more VGAM2279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77869] It is yet further appreciated that a function of VGAM2279 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2279 correlate with, and may be deduced from, the identity of the host target genes which VGAM2279 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77870] Nucleotide sequences of the VGAM2279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2279 are further described hereinbelow with reference to Table 1.

[77871] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2279 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2279 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[77872] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2279 gene, herein designated VGAM is inhibition of expression of VGAM2279 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2279 correlate with, and may be deduced from, the identity of the target genes which VGAM2279 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77873] Guanine Nucleotide Binding Protein (G protein), Alpha Z Polypeptide (GNAZ, Accession NM_002073) is a VGAM2279 host target gene. GNAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAZ BINDING SITE, designated SEQ ID:7844, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77874] A function of VGAM2279 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Z Polypeptide (GNAZ, Accession NM_002073), a gene which func-

tions as modulator or transducer in various transmembrane signaling systems. Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAZ. The function of GNAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1508.Zinc Finger Protein 265 (ZNF265, Accession NM_005455) is another VGAM2279 host target gene. ZNF265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF265 BINDING SITE, designated SEQ ID:11939, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77875] Another function of VGAM2279 is therefore inhibition of Zinc Finger Protein 265 (ZNF265, Accession NM_005455). Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF265. BCL2-associated Athano-

gene 2 (BAG2, Accession XM_165779) is another VGAM2279 host target gene. BAG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG2 BINDING SITE, designated SEQ ID:43751, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77876] Another function of VGAM2279 is therefore inhibition of BCL2-associated Athanogene 2 (BAG2, Accession XM_165779). Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG2. DEFCAP (Accession NM_033004) is another VGAM2279 host target gene. DEFCAP BINDING SITE1 through DEFCAP BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DEFCAP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEFCAP BINDING SITE1 through DEFCAP BINDING SITE3, designated SEQ

ID:26891, SEQ ID:26892 and SEQ ID:17200 respectively, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77877] Another function of VGAM2279 is therefore inhibition of DEFCAP (Accession NM_033004). Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEFCAP. FLJ21140 (Accession NM_024776) is another VGAM2279 host target gene. FLJ21140 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21140 BINDING SITE, designated SEQ ID:24138, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77878] Another function of VGAM2279 is therefore inhibition of FLJ21140 (Accession NM_024776). Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21140. RALGPS1A (Accession NM_014636) is another VGAM2279 host target gene. RALGPS1A BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16015, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77879] Another function of VGAM2279 is therefore inhibition of RALGPS1A (Accession NM_014636). Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALGPS1A. Thioesterase, Adipose Associated (THEA, Accession XM_038922) is another VGAM2279 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32945, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77880] Another function of VGAM2279 is therefore inhibition of

Thioesterase, Adipose Associated (THEA, Accession XM_038922). Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. LOC146515 (Accession XM_085493) is another VGAM2279 host target gene. LOC146515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146515 BINDING SITE, designated SEQ ID:38191, to the nucleotide sequence of VGAM2279 RNA, herein designated VGAM RNA, also designated SEQ ID:4990.

[77881] Another function of VGAM2279 is therefore inhibition of LOC146515 (Accession XM_085493). Accordingly, utilities of VGAM2279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146515. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2280 (VGAM2280) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[77882] VGAM2280 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2280 was detected is described hereinabove with reference to Figs. 1-8.

[77883] VGAM2280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77884] VGAM2280 gene encodes a VGAM2280 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2280 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2280 precursor RNA is designated SEQ ID:2266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2266 is located at position 27049 relative to the genome of Alcelaphine Herpesvirus 1.

[77885] VGAM2280 precursor RNA folds onto itself, forming VGAM2280 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77886] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2280 folded precursor RNA into VGAM2280 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2280 RNA is designated SEQ ID:4991, and is provided hereinbelow with reference to the sequence listing part.

[77887] VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2280 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77888] VGAM2280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2280 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77889] The complementary binding of VGAM2280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2280 host target RNA into VGAM2280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77890] It is appreciated that VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2280 host target genes. The mRNA of each one of this plurality of VGAM2280 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2280 RNA, herein designated VGAM RNA, and which when bound by VGAM2280 RNA causes inhibition of translation of respective one or more VGAM2280 host target proteins.

[77891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2280 gene, herein designated VGAM GENE, on one or more VGAM2280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77892] It is yet further appreciated that a function of VGAM2280 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2280 correlate with, and may be deduced from, the identity of the host target genes which VGAM2280 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[77893] Nucleotide sequences of the VGAM2280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2280 are further described hereinbelow with reference to Table 1.

[77894] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2280 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77895] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2280 gene, herein designated VGAM is inhibition of expression of VGAM2280 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2280 correlate with, and may be deduced from, the identity of the target genes which VGAM2280 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77896] ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052) is a VGAM2280 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5491, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77897] A function of VGAM2280 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Dachshund Homolog (Drosophila) (DACH, Accession NM_080759) is another VGAM2280 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DACH BINDING SITE, designated SEQ ID:28043, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77898] Another function of VGAM2280 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260.Faciogenital Dysplasia (Aarskog-Scott syndrome) (FGD1, Accession NM_004463) is another VGAM2280 host target gene. FGD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGD1 BINDING SITE, designated SEQ ID:10767, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4991.

[77899] Another function of VGAM2280 is therefore inhibition of Faciogenital Dysplasia (Aarskog-Scott syndrome) (FGD1, Accession NM_004463), a gene which activates the ras-like family of rho- and rac proteins by exchanging bound gdp for free gtp. Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGD1. The function of FGD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1593.Glycogenin (GYG, Accession NM_004130) is another VGAM2280 host target gene. GYG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GYG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GYG BINDING SITE, designated SEQ ID:10337, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77900] Another function of VGAM2280 is therefore inhibition of Glycogenin (GYG, Accession NM_004130), a gene which

primes de novo glycogen synthesis. Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GYG. The function of GYG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM777.PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_006201) is another VGAM2280 host target gene. PCTK1 BINDING SITE1 through PCTK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCTK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK1 BINDING SITE1 through PCTK1 BINDING SITE3, designated SEQ ID:12871, SEQ ID:26906 and SEQ ID:26912 respectively, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77901] Another function of VGAM2280 is therefore inhibition of PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_006201), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM2280 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PCTK1. The function of PCTK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75.RalA Binding Protein 1 (RALBP1, Accession NM_006788) is another VGAM2280 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13658, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77902] Another function of VGAM2280 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345.Solute Carrier Family 35 (CMP-sialic acid transporter), Member 1 (SLC35A1, Accession NM_006416) is another VGAM2280 host target gene. SLC35A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC35A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC35A1 BINDING SITE, designated SEQ ID:13125, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77903] Another function of VGAM2280 is therefore inhibition of Solute Carrier Family 35 (CMP-sialic acid transporter), Member 1 (SLC35A1, Accession NM_006416), a gene which transports cmp-sialic acid from the cytosol into golgi vesicles. Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC35A1. The function of SLC35A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM152.Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080704) is another VGAM2280 host target gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ ID:27993, SEQ ID:28001, SEQ ID:28009 and SEQ ID:20813 respectively, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77904] Another function of VGAM2280 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080704), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146.Oxysterol Binding Protein-like 10

(OSBPL10, Accession NM_017784) is another VGAM2280 host target gene. OSBPL10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL10 BINDING SITE, designated SEQ ID:19415, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77905] Another function of VGAM2280 is therefore inhibition of Oxysterol Binding Protein-like 10 (OSBPL10, Accession NM_017784). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL10. Transducin-like Enhancer of Split 4 (E(sp1) Homolog, Drosophila) (TLE4, Accession XM_042357) is another VGAM2280 host target gene. TLE4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TLE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLE4 BINDING SITE, designated SEQ ID:33719,

to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77906] Another function of VGAM2280 is therefore inhibition of Transducin-like Enhancer of Split 4 (E(sp1) Homolog, Drosophila) (TLE4, Accession XM_042357). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLE4. Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM_013282) is another VGAM2280 host target gene. UHRF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UHRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF1 BINDING SITE, designated SEQ ID:14950, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77907] Another function of VGAM2280 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM_013282). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF1.

LOC126133 (Accession XM_058991) is another VGAM2280 host target gene. LOC126133 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126133 BINDING SITE, designated SEQ ID:36804, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77908] Another function of VGAM2280 is therefore inhibition of LOC126133 (Accession XM_058991). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126133. LOC142948 (Accession XM_096364) is another VGAM2280 host target gene. LOC142948 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142948 BINDING SITE, designated SEQ ID:40325, to the nucleotide sequence of VGAM2280 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4991.

[77909] Another function of VGAM2280 is therefore inhibition of LOC142948 (Accession XM_096364). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142948. LOC159160 (Accession XM_018413) is another VGAM2280 host target gene. LOC159160 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159160 BINDING SITE, designated SEQ ID:30358, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77910] Another function of VGAM2280 is therefore inhibition of LOC159160 (Accession XM_018413). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159160. LOC91947 (Accession XM_041721) is another VGAM2280 host target gene. LOC91947 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91947, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91947 BINDING SITE, designated SEQ ID:33570, to the nucleotide sequence of VGAM2280 RNA, herein designated VGAM RNA, also designated SEQ ID:4991.

[77911] Another function of VGAM2280 is therefore inhibition of LOC91947 (Accession XM_041721). Accordingly, utilities of VGAM2280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91947. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2281 (VGAM2281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77912] VGAM2281 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2281 was detected is described hereinabove with reference to Figs. 1-8.

[77913] VGAM2281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus.

VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77914] VGAM2281 gene encodes a VGAM2281 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2281 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2281 precursor RNA is designated SEQ ID:2267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2267 is located at position 22070 relative to the genome of Murine Hepatitis Virus.

[77915] VGAM2281 precursor RNA folds onto itself, forming VGAM2281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77916] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2281 folded precursor RNA into VGAM2281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2281 RNA is designated SEQ ID:4992, and is provided hereinbelow with reference to the sequence listing part.

[77917] VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2281 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77918] VGAM2281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2281 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2281 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77919] The complementary binding of VGAM2281 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2281 host target RNA into VGAM2281 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77920] It is appreciated that VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2281 host target genes. The mRNA of each one of this plurality of VGAM2281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2281 RNA, herein designated VGAM RNA, and which when bound by VGAM2281 RNA causes inhibition of translation of respective one or more VGAM2281 host target proteins.

[77921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2281 gene, herein designated VGAM GENE, on one or more VGAM2281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77922] It is yet further appreciated that a function of VGAM2281 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2281 correlate with, and may be deduced from, the identity of the host target genes which VGAM2281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77923] Nucleotide sequences of the VGAM2281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2281 are further described hereinbelow with reference to Table 1.

[77924] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2281 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2281 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77925] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2281 gene, herein designated VGAM is inhibition of expression of VGAM2281 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2281 correlate with, and may be deduced from, the identity of the target genes which VGAM2281 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77926] Forkhead Box D2 (FOXD2, Accession NM_004474) is a VGAM2281 host target gene. FOXD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD2 BINDING SITE, designated SEQ ID:10791, to the nucleotide se-

quence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77927] A function of VGAM2281 is therefore inhibition of Forkhead Box D2 (FOXD2, Accession NM_004474). Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD2. Glioblastoma Amplified Sequence (GBAS, Accession NM_001483) is another VGAM2281 host target gene. GBAS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GBAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBAS BINDING SITE, designated SEQ ID:7226, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77928] Another function of VGAM2281 is therefore inhibition of Glioblastoma Amplified Sequence (GBAS, Accession NM_001483), a gene which might be involved in vesicular transport. Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBAS. The function of GBAS and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM859.Hyaluronan Synthase 3 (HAS3, Accession NM_005329) is another VGAM2281 host target gene. HAS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAS3 BINDING SITE, designated SEQ ID:11804, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77929] Another function of VGAM2281 is therefore inhibition of Hyaluronan Synthase 3 (HAS3, Accession NM_005329), a gene which plays a role in hyaluronan/hyaluronic acid (ha) synthesis. Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAS3. The function of HAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM498.Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Syn-

thetase (PAICS, Accession NM_006452) is another VGAM2281 host target gene. PAICS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAICS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:13164, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77930] Another function of VGAM2281 is therefore inhibition of Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM_006452), a gene which is required for purine biosynthesis. Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS. The function of PAICS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.CLONE24945 (Accession NM_015683) is another VGAM2281 host target gene. CLONE24945 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by CLONE24945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLONE24945 BINDING SITE, designated SEQ ID:17906, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77931] Another function of VGAM2281 is therefore inhibition of CLONE24945 (Accession NM_015683). Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLONE24945. CRMP5 (Accession NM_020134) is another VGAM2281 host target gene. CRMP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRMP5 BINDING SITE, designated SEQ ID:21333, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77932] Another function of VGAM2281 is therefore inhibition of CRMP5 (Accession NM_020134). Accordingly, utilities of

VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRMP5. KIAA0420 (Accession XM_032693) is another VGAM2281 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31725, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77933] Another function of VGAM2281 is therefore inhibition of KIAA0420 (Accession XM_032693). Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA1198 (Accession XM_032674) is another VGAM2281 host target gene. KIAA1198 BINDING SITE1 and KIAA1198 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1198, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA1198 BINDING SITE1 and KIAA1198 BINDING SITE2, designated SEQ ID:31705 and SEQ ID:31717 respectively, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77934] Another function of VGAM2281 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. LOC148114 (Accession XM_086050) is another VGAM2281 host target gene. LOC148114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148114 BINDING SITE, designated SEQ ID:38464, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77935] Another function of VGAM2281 is therefore inhibition of LOC148114 (Accession XM_086050). Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148114. LOC257354 (Accession XM_170810) is another VGAM2281 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45578, to the nucleotide sequence of VGAM2281 RNA, herein designated VGAM RNA, also designated SEQ ID:4992.

[77936] Another function of VGAM2281 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM2281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2282 (VGAM2282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77937] VGAM2282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2282 was detected is described hereinabove with reference to Figs. 1-8.

[77938] VGAM2282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77939] VGAM2282 gene encodes a VGAM2282 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2282 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2282 precursor RNA is designated SEQ ID:2268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2268 is located at position 26667 relative to the genome of Murine Hepatitis Virus.

[77940] VGAM2282 precursor RNA folds onto itself, forming VGAM2282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2282 folded precursor RNA into VGAM2282 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2282 RNA is designated SEQ ID:4993, and is provided hereinbelow with reference to the sequence listing part.

[77942] VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2282 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77943] VGAM2282 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2282 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2282 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77944] The complementary binding of VGAM2282 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2282 host target RNA into VGAM2282 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77945] It is appreciated that VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2282 host target genes. The mRNA of each one of this plurality of VGAM2282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2282 RNA, herein designated VGAM RNA, and which when bound by VGAM2282 RNA causes inhibition of translation of respective one or more VGAM2282 host target proteins.

[77946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2282 gene, herein designated VGAM GENE, on one or more VGAM2282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[77947] It is yet further appreciated that a function of VGAM2282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2282 correlate with, and may be deduced from, the identity of the host target genes which VGAM2282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[77948] Nucleotide sequences of the VGAM2282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2282 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2282 are further described hereinbelow with reference to Table 1.

[77949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2282 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2282 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[77950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2282 gene, herein designated VGAM is inhibition of expression of VGAM2282 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2282 correlate with, and may be deduced from, the identity of the target genes which VGAM2282 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[77951] Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM_042963) is a VGAM2282 host target gene. ARHGEF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by ARHGEF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF6 BINDING SITE, designated SEQ ID:33844, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77952] A function of VGAM2282 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM_042963). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. Bromodomain Adjacent to Zinc Finger Domain, 1B (BAZ1B, Accession NM_032408) is another VGAM2282 host target gene. BAZ1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAZ1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAZ1B BINDING SITE, designated SEQ ID:26191, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77953] Another function of VGAM2282 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 1B (BAZ1B, Accession NM_032408). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ1B. Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM_004384) is another VGAM2282 host target gene. CSNK1G3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSNK1G3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1G3 BINDING SITE, designated SEQ ID:10610, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77954] Another function of VGAM2282 is therefore inhibition of Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM_004384). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G3. Glutaminase (GLS, Accession NM_014905) is another VGAM2282 host target gene. GLS BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17108, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77955] Another function of VGAM2282 is therefore inhibition of Glutaminase (GLS, Accession NM_014905). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. LENG4 (Accession NM_024298) is another VGAM2282 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23580, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77956] Another function of VGAM2282 is therefore inhibition of LENG4 (Accession NM_024298), a gene which may be a

transmembrane protein. Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.Polycystic Kidney Disease 2 (autosomal dominant) (PKD2, Accession XM_011124) is another VGAM2282 host target gene. PKD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PKD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD2 BINDING SITE, designated SEQ ID:30177, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77957] Another function of VGAM2282 is therefore inhibition of Polycystic Kidney Disease 2 (autosomal dominant) (PKD2, Accession XM_011124). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2. Synaptosomal-associated Protein, 25kDa (SNAP25, Acces-

sion NM_130811) is another VGAM2282 host target gene. SNAP25 BINDING SITE1 and SNAP25 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNAP25, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP25 BINDING SITE1 and SNAP25 BINDING SITE2, designated SEQ ID:28318 and SEQ ID:9055 respectively, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77958] Another function of VGAM2282 is therefore inhibition of Synaptosomal-associated Protein, 25kDa (SNAP25, Accession NM_130811). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP25. WAS Protein Family, Member 3 (WASF3, Accession NM_006646) is another VGAM2282 host target gene. WASF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WASF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WASF3 BIND-

ING SITE, designated SEQ ID:13440, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77959] Another function of VGAM2282 is therefore inhibition of WAS Protein Family, Member 3 (WASF3, Accession NM_006646), a gene which stimulates actin polymerization. Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF3. The function of WASF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1692.Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919) is another VGAM2282 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:17176, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77960] Another function of VGAM2282 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM_019555) is another VGAM2282 host target gene. ARHGEF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF3 BINDING SITE, designated SEQ ID:21211, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77961] Another function of VGAM2282 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM_019555). Accordingly, utilities

of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF3. BCE-1 (Accession NM_007005) is another VGAM2282 host target gene. BCE-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BCE-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCE-1 BINDING SITE, designated SEQ ID:13868, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77962] Another function of VGAM2282 is therefore inhibition of BCE-1 (Accession NM_007005). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCE-1. Chromosome 19 Open Reading Frame 7 (C19orf7, Accession XM_028253) is another VGAM2282 host target gene. C19orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C19orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C19orf7 BINDING SITE, designated SEQ ID:30635, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77963] Another function of VGAM2282 is therefore inhibition of Chromosome 19 Open Reading Frame 7 (C19orf7, Accession XM_028253). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C19orf7. Chromosome 20 Open Reading Frame 36 (C20orf36, Accession NM_018257) is another VGAM2282 host target gene. C20orf36 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf36 BINDING SITE, designated SEQ ID:20222, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77964] Another function of VGAM2282 is therefore inhibition of Chromosome 20 Open Reading Frame 36 (C20orf36, Accession NM_018257). Accordingly, utilities of VGAM2282

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf36. CHCR (Accession NM_018388) is another VGAM2282 host target gene. CHCR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHCR BINDING SITE, designated SEQ ID:20421, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77965] Another function of VGAM2282 is therefore inhibition of CHCR (Accession NM_018388). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHCR. Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM_017770) is another VGAM2282 host target gene. ELOVL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELOVL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ELOVL2 BINDING SITE, designated SEQ ID:19388, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77966] Another function of VGAM2282 is therefore inhibition of Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM_017770). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL2. ERAP140 (Accession XM_059748) is another VGAM2282 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37083, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77967] Another function of VGAM2282 is therefore inhibition of ERAP140 (Accession XM_059748). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

ERAP140. FLJ10781 (Accession NM_018215) is another VGAM2282 host target gene. FLJ10781 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE, designated SEQ ID:20139, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77968] Another function of VGAM2282 is therefore inhibition of FLJ10781 (Accession NM_018215). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10781. FLJ13162 (Accession NM_025002) is another VGAM2282 host target gene. FLJ13162 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13162 BINDING SITE, designated SEQ ID:24572, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM

RNA, also designated SEQ ID:4993.

[77969] Another function of VGAM2282 is therefore inhibition of FLJ13162 (Accession NM_025002). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13162. FLJ20130 (Accession NM_017681) is another VGAM2282 host target gene. FLJ20130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20130 BINDING SITE, designated SEQ ID:19226, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77970] Another function of VGAM2282 is therefore inhibition of FLJ20130 (Accession NM_017681). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20130. FLJ20344 (Accession NM_017776) is another VGAM2282 host target gene. FLJ20344 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20344, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20344 BINDING SITE, designated SEQ ID:19402, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77971] Another function of VGAM2282 is therefore inhibition of FLJ20344 (Accession NM_017776). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20344. FLJ20972 (Accession NM_025030) is another VGAM2282 host target gene. FLJ20972 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20972 BINDING SITE, designated SEQ ID:24623, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77972] Another function of VGAM2282 is therefore inhibition of FLJ20972 (Accession NM_025030). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20972. FLJ23462 (Accession NM_024843) is another VGAM2282 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24262, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77973] Another function of VGAM2282 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM2282 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE,

designated SEQ ID:7861, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77974] Another function of VGAM2282 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. KIAA0820 (Accession XM_044463) is another VGAM2282 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34217, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77975] Another function of VGAM2282 is therefore inhibition of KIAA0820 (Accession XM_044463). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. KIAA1281 (Accession XM_114432) is another

VGAM2282 host target gene. KIAA1281 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1281 BINDING SITE, designated SEQ ID:42960, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77976] Another function of VGAM2282 is therefore inhibition of KIAA1281 (Accession XM_114432). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1281. KIAA1775 (Accession NM_033100) is another VGAM2282 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26938, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77977] Another function of VGAM2282 is therefore inhibition of KIAA1775 (Accession NM_033100). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. KIAA1925 (Accession XM_166375) is another VGAM2282 host target gene. KIAA1925 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1925 BINDING SITE, designated SEQ ID:44207, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77978] Another function of VGAM2282 is therefore inhibition of KIAA1925 (Accession XM_166375). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1925. KIAA1987 (Accession XM_113870) is another VGAM2282 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42492, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77979] Another function of VGAM2282 is therefore inhibition of KIAA1987 (Accession XM_113870). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983) is another VGAM2282 host target gene. NAPG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPG BINDING SITE, designated SEQ ID:46253, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77980] Another function of VGAM2282 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983). Accordingly, utili-

ties of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPG. Peroxisomal Biogenesis Factor 12 (PEX12, Accession NM_000286) is another VGAM2282 host target gene. PEX12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX12 BINDING SITE, designated SEQ ID:5831, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77981] Another function of VGAM2282 is therefore inhibition of Peroxisomal Biogenesis Factor 12 (PEX12, Accession NM_000286). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX12. PSR (Accession XM_036784) is another VGAM2282 host target gene. PSR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PSR BINDING SITE, designated SEQ ID:32497, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77982] Another function of VGAM2282 is therefore inhibition of PSR (Accession XM_036784). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR. SES2 (Accession NM_031459) is another VGAM2282 host target gene. SES2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SES2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SES2 BINDING SITE, designated SEQ ID:25480, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77983] Another function of VGAM2282 is therefore inhibition of SES2 (Accession NM_031459). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SES2. Thioesterase, Adipose Associated (THEA, Accession

XM_038922) is another VGAM2282 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32947, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77984] Another function of VGAM2282 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM_038922). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. Ubiquitin Specific Protease 24 (USP24, Accession XM_165973) is another VGAM2282 host target gene. USP24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP24 BINDING SITE, designated SEQ ID:43814, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4993.

[77985] Another function of VGAM2282 is therefore inhibition of Ubiquitin Specific Protease 24 (USP24, Accession XM_165973). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP24. LOC145815 (Accession XM_096874) is another VGAM2282 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40607, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77986] Another function of VGAM2282 is therefore inhibition of LOC145815 (Accession XM_096874). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. LOC146449 (Accession XM_028046) is another VGAM2282 host target gene. LOC146449 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC146449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146449 BINDING SITE, designated SEQ ID:30611, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77987] Another function of VGAM2282 is therefore inhibition of LOC146449 (Accession XM_028046). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146449. LOC197414 (Accession XM_113880) is another VGAM2282 host target gene. LOC197414 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197414 BINDING SITE, designated SEQ ID:42515, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77988] Another function of VGAM2282 is therefore inhibition of LOC197414 (Accession XM_113880). Accordingly, utilities

of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197414. LOC221002 (Accession XM_166156) is another VGAM2282 host target gene. LOC221002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221002 BINDING SITE, designated SEQ ID:43976, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77989] Another function of VGAM2282 is therefore inhibition of LOC221002 (Accession XM_166156). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221002. LOC83693 (Accession NM_031463) is another VGAM2282 host target gene. LOC83693 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC83693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC83693 BINDING SITE, designated SEQ ID:25498, to the nucleotide sequence of VGAM2282 RNA, herein designated VGAM RNA, also designated SEQ ID:4993.

[77990] Another function of VGAM2282 is therefore inhibition of LOC83693 (Accession NM_031463). Accordingly, utilities of VGAM2282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83693. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2283 (VGAM2283) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[77991] VGAM2283 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2283 was detected is described hereinabove with reference to Figs. 1-8.

[77992] VGAM2283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[77993] VGAM2283 gene encodes a VGAM2283 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2283 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2283 precursor RNA is designated SEQ ID:2269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2269 is located at position 23988 relative to the genome of Murine Hepatitis Virus.

[77994] VGAM2283 precursor RNA folds onto itself, forming VGAM2283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[77995] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2283 folded precursor RNA into VGAM2283 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2283 RNA is designated SEQ ID:4994, and is provided hereinbelow with reference to the sequence listing part.

[77996] VGAM2283 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2283 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[77997] VGAM2283 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2283 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[77998] The complementary binding of VGAM2283 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2283 host target RNA into VGAM2283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[77999] It is appreciated that VGAM2283 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2283 host target genes. The mRNA of each one of this plurality of VGAM2283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2283 RNA, herein designated VGAM RNA, and which when bound by VGAM2283 RNA causes inhibition of translation of respective one or more VGAM2283 host target proteins.

[78000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2283 gene, herein designated VGAM GENE, on one or more VGAM2283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78001] It is yet further appreciated that a function of VGAM2283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2283 correlate with, and may be deduced from, the identity of the host target genes which VGAM2283 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78002] Nucleotide sequences of the VGAM2283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2283 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2283 are further described hereinbelow with reference to Table 1.

[78003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2283 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78004] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2283 gene, herein designated VGAM is inhibition of expression of VGAM2283 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2283 correlate with, and may be deduced from, the identity of the target genes which VGAM2283 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78005] Frizzled Homolog 10 (Drosophila) (FZD10, Accession NM_007197) is a VGAM2283 host target gene. FZD10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD10 BINDING SITE, designated SEQ ID:14052, to the nucleotide sequence of VGAM2283 RNA, herein designated VGAM RNA, also designated SEQ ID:4994.

[78006] A function of VGAM2283 is therefore inhibition of Frizzled

Homolog 10 (Drosophila) (FZD10, Accession NM_007197). Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD10. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM2283 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:18997, to the nucleotide sequence of VGAM2283 RNA, herein designated VGAM RNA, also designated SEQ ID:4994.

[78007] Another function of VGAM2283 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. CL683 (Accession NM_015696) is another VGAM2283 host target gene. CL683 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CL683, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CL683 BINDING SITE, designated SEQ ID:17925, to the nucleotide sequence of VGAM2283 RNA, herein designated VGAM RNA, also designated SEQ ID:4994.

[78008] Another function of VGAM2283 is therefore inhibition of CL683 (Accession NM_015696). Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CL683. FLJ13710 (Accession NM_024817) is another VGAM2283 host target gene. FLJ13710 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:24203, to the nucleotide sequence of VGAM2283 RNA, herein designated VGAM RNA, also designated SEQ ID:4994.

[78009] Another function of VGAM2283 is therefore inhibition of FLJ13710 (Accession NM_024817). Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13710. KIAA1679 (Accession XM_046570) is another VGAM2283 host target gene. KIAA1679 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1679 BINDING SITE, designated SEQ ID:34749, to the nucleotide sequence of VGAM2283 RNA, herein designated VGAM RNA, also designated SEQ ID:4994.

[78010] Another function of VGAM2283 is therefore inhibition of KIAA1679 (Accession XM_046570). Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1679. PLU-1 (Accession XM_113375) is another VGAM2283 host target gene. PLU-1 BINDING SITE1 and PLU-1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLU-1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLU-1 BINDING SITE1 and PLU-1 BINDING

SITE2, designated SEQ ID:42250 and SEQ ID:13401 respectively, to the nucleotide sequence of VGAM2283 RNA, herein designated VGAM RNA, also designated SEQ ID:4994.

[78011] Another function of VGAM2283 is therefore inhibition of PLU-1 (Accession XM_113375). Accordingly, utilities of VGAM2283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLU-1. Heterogeneous Nuclear Ribonucleoprotein U (scaffold attachment factor A) (HNRPU, Accession NM_004501) is another VGAM2284 host target gene. HNRPU BINDING SITE1 and HNRPU BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPU BINDING SITE1 and HNRPU BINDING SITE2, designated SEQ ID:10836 and SEQ ID:25580 respectively, to the nucleotide sequence of VGAM2284 RNA, herein designated VGAM RNA, also designated SEQ ID:4995.

[78012] Another function of VGAM2284 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein U (scaffold at-

tachment factor A) (HNRPU, Accession NM_004501). Accordingly, utilities of VGAM2284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPU. LOC148254 (Accession XM_086121) is another VGAM2284 host target gene. LOC148254 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148254 BINDING SITE, designated SEQ ID:38501, to the nucleotide sequence of VGAM2284 RNA, herein designated VGAM RNA, also designated SEQ ID:4995.

[78013] Another function of VGAM2284 is therefore inhibition of LOC148254 (Accession XM_086121). Accordingly, utilities of VGAM2284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148254. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2285 (VGAM2285) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[78014] VGAM2285 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2285 was detected is described hereinabove with reference to Figs. 1-8.

[78015] VGAM2285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78016] VGAM2285 gene encodes a VGAM2285 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2285 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2285 precursor RNA is designated SEQ ID:2271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2271 is located at position 13151 relative to the genome of Murine Hepatitis Virus.

[78017] VGAM2285 precursor RNA folds onto itself, forming VGAM2285 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78018] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2285 folded precursor RNA into VGAM2285 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2285 RNA is designated SEQ ID:4996, and is provided hereinbelow with reference to the sequence listing part.

[78019] VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2285 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78020] VGAM2285 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2285 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78021] The complementary binding of VGAM2285 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2285 host target RNA into VGAM2285 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78022] It is appreciated that VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2285 host target genes. The mRNA of each one of this plurality of VGAM2285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2285 RNA, herein designated VGAM RNA, and which when bound by VGAM2285 RNA causes inhibition of translation of respective one or more VGAM2285 host target proteins.

[78023] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2285 gene, herein designated VGAM GENE, on one or more VGAM2285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78024] It is yet further appreciated that a function of VGAM2285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2285 correlate with, and may be deduced from, the identity of the host target genes which VGAM2285 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[78025] Nucleotide sequences of the VGAM2285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2285 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2285 are further described hereinbelow with reference to Table 1.

[78026] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2285 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78027] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2285 gene, herein designated VGAM is inhibition of expression of VGAM2285 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2285 correlate with, and may be deduced from, the identity of the target genes which VGAM2285 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78028] Adrenergic, Alpha-2B-, Receptor (ADRA2B, Accession NM_000682) is a VGAM2285 host target gene. ADRA2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADRA2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA2B BINDING SITE, designated SEQ ID:6339, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78029] A function of VGAM2285 is therefore inhibition of Adrenergic, Alpha-2B-, Receptor (ADRA2B, Accession NM_000682), a gene which mediate the catecholamine-induced inhibition of adenylate cyclase through the action of g proteins. Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRA2B. The function of ADRA2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM609.B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633) is another VGAM2285 host target gene.

BCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6254, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78030] Another function of VGAM2285 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. Clock Homolog (mouse) (CLOCK, Accession NM_004898) is another VGAM2285 host target gene. CLOCK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLOCK BINDING SITE, designated SEQ ID:11334, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78031] Another function of VGAM2285 is therefore inhibition of Clock Homolog (mouse) (CLOCK, Accession NM_004898). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLOCK. Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141) is another VGAM2285 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15415, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78032] Another function of VGAM2285 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542) is another VGAM2285 host target gene. HGF BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45218, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78033] Another function of VGAM2285 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174.Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 2 (KCNN2, Accession NM_021614) is another VGAM2285 host target gene. KCNN2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNN2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNN2 BINDING SITE, designated SEQ ID:22242, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78034] Another function of VGAM2285 is therefore inhibition of Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 2 (KCNN2, Accession NM_021614), a gene which forms a voltage-independent potassium channel activated by intracellular calcium. Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN2. The function of KCNN2 has been established by previous studies. Calcium-activated potassium channels respond to changes in intracellular calcium concentration and couple calcium metabolism to potassium flux and membrane excitability. Based on their electrophysiologic properties, calcium-activated potassium channels are classified as large conductance, calcium- and voltage-gated channels (BK, e.g., KCNMB4; 605223), intermediate conductance, voltage-independent channels (IK, e.g., KCNN4; 602754), and

small conductance, voltage-independent channels (SK, e.g., KCNN3; 602983). By screening a Jurkat T-cell cDNA library using RT-PCR with degenerate primers based on rat and human SK channels, followed by searching an EST database, Desai et al. (2000) isolated a cDNA encoding KCNN2, which they termed SK2. Sequence analysis predicted that the 579-amino acid protein, which is 97% identical to the rat sequence, contains multiple phosphorylation sites and no N-glycosylation sites. Northern blot analysis detected a major 2.5-kb transcript that was expressed most strongly in liver and brain, with lower levels in kidney and Jurkat (but not peripheral) T cells. A minor 4.4-kb transcript was expressed in heart and skeletal muscle, and a 1.3-kb transcript was expressed in brain and liver. Functional analysis showed that KCNN2 expresses a potassium current that is sensitive to apamin, scyllatoxin, and tubocurarine and is insensitive to charybdotoxin. Schumacher et al. (2001) determined the crystal structure of calmodulin (OMIM Ref. No. 114180) bound to KCNN2. The calmodulin-binding domain forms an elongated dimer with a calmodulin molecule bound at each end; each calmodulin wraps around 3 alpha helices, 2 from 1 calmodulin-binding domain subunit and 1 from

the other.

[78035] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78036] Desai, R.; Peretz, A.; Idelson, H.; Lazarovici, P.; Attali, B. : Ca(2+)-activated K(+) channels in human leukemic Jurkat T cells: molecular cloning, biochemical and functional characterization. J. Biol. Chem. 275: 39954-39963, 2000. ; and

[78037] Schumacher, M. A.; Rivard, A. F.; Bachinger, H. P.; Adelman, J. P. : Structure of the gating domain of a Ca(2+)-activated K+ channel complexed with Ca(2+)/calmodulin. Nature 410: 1120-.

[78038] Further studies establishing the function and utilities of KCNN2 are found in John Hopkins OMIM database record ID 605879, and in sited publications numbered 700 and 12582 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226) is another VGAM2285 host target gene. RNPEPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNPEPL1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPEPL1 BINDING SITE, designated SEQ ID:20159, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78039] Another function of VGAM2285 is therefore inhibition of Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM_018226). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPEPL1. TM7SF3 (Accession XM_006748) is another VGAM2285 host target gene. TM7SF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TM7SF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM7SF3 BINDING SITE, designated SEQ ID:30010, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78040] Another function of VGAM2285 is therefore inhibition of TM7SF3 (Accession XM_006748). Accordingly, utilities of

VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM7SF3. FLJ10388 (Accession NM_018082) is another VGAM2285 host target gene. FLJ10388 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10388 BINDING SITE, designated SEQ ID:19844, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78041] Another function of VGAM2285 is therefore inhibition of FLJ10388 (Accession NM_018082). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10388. KIAA1879 (Accession XM_056635) is another VGAM2285 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1879 BINDING SITE, designated SEQ ID:36409, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78042] Another function of VGAM2285 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. LOC157697 (Accession XM_088365) is another VGAM2285 host target gene. LOC157697 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157697 BINDING SITE, designated SEQ ID:39647, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78043] Another function of VGAM2285 is therefore inhibition of LOC157697 (Accession XM_088365). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157697. LOC219894 (Accession XM_167782) is another VGAM2285 host target gene. LOC219894 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:44794, to the nucleotide sequence of VGAM2285 RNA, herein designated VGAM RNA, also designated SEQ ID:4996.

[78044] Another function of VGAM2285 is therefore inhibition of LOC219894 (Accession XM_167782). Accordingly, utilities of VGAM2285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2286 (VGAM2286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78045] VGAM2286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2286 was detected is described hereinabove with reference to Figs. 1-8.

[78046] VGAM2286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78047] VGAM2286 gene encodes a VGAM2286 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2286 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2286 precursor RNA is designated SEQ ID:2272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2272 is located at position 4778 relative to the genome of Murine Hepatitis Virus.

[78048] VGAM2286 precursor RNA folds onto itself, forming VGAM2286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[78049] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2286 folded precursor RNA into VGAM2286 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM2286 RNA is designated SEQ ID:4997, and is provided hereinbelow with reference to the sequence listing part.

[78050] VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2286 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78051] VGAM2286 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2286 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2286 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2286 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78052] The complementary binding of VGAM2286 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2286 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2286 host target RNA into VGAM2286 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78053] It is appreciated that VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2286 host target genes. The mRNA of each one of this plurality of VGAM2286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2286 RNA, herein designated VGAM RNA, and which when bound by VGAM2286 RNA causes inhibition of translation of respective one or more VGAM2286 host target proteins.

[78054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2286 gene, herein designated VGAM GENE, on one or more VGAM2286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78055] It is yet further appreciated that a function of VGAM2286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2286 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2286 correlate with, and may be deduced from, the identity of the host target genes which VGAM2286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78056] Nucleotide sequences of the VGAM2286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2286 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2286 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2286 are further described hereinbelow with reference to Table 1.

[78057] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2286 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78058] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2286 gene, herein designated VGAM is inhibition of expression of VGAM2286 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2286 correlate with, and may be deduced from, the identity of the target genes which VGAM2286 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78059] FLJ14346 (Accession NM_025029) is a VGAM2286 host target gene. FLJ14346 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ14346 BINDING SITE, designated SEQ ID:24620, to the nucleotide sequence of VGAM2286 RNA, herein designated VGAM RNA, also designated SEQ ID:4997.

[78060] A function of VGAM2286 is therefore inhibition of FLJ14346 (Accession NM_025029). Accordingly, utilities of VGAM2286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14346. FLJ20366 (Accession NM_017786) is another VGAM2286 host target gene. FLJ20366 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20366, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20366 BINDING SITE, designated SEQ ID:19418, to the nucleotide sequence of VGAM2286 RNA, herein designated VGAM RNA, also designated SEQ ID:4997.

[78061] Another function of VGAM2286 is therefore inhibition of FLJ20366 (Accession NM_017786). Accordingly, utilities of VGAM2286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20366. NIR3 (Accession XM_038799) is another

VGAM2286 host target gene. NIR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NIR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIR3 BINDING SITE, designated SEQ ID:32928, to the nucleotide sequence of VGAM2286 RNA, herein designated VGAM RNA, also designated SEQ ID:4997.

[78062] Another function of VGAM2286 is therefore inhibition of NIR3 (Accession XM_038799). Accordingly, utilities of VGAM2286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIR3. LOC92492 (Accession XM_045396) is another VGAM2286 host target gene. LOC92492 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92492 BINDING SITE, designated SEQ ID:34452, to the nucleotide sequence of VGAM2286 RNA, herein designated VGAM RNA, also designated SEQ ID:4997.

[78063] Another function of VGAM2286 is therefore inhibition of LOC92492 (Accession XM_045396). Accordingly, utilities of VGAM2286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92492. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2287 (VGAM2287) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78064] VGAM2287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2287 was detected is described hereinabove with reference to Figs. 1-8.

[78065] VGAM2287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78066] VGAM2287 gene encodes a VGAM2287 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2287 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2287 precursor RNA is designated SEQ ID:2273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2273 is located at position 3614 relative to the genome of Murine Hepatitis Virus.

[78067] VGAM2287 precursor RNA folds onto itself, forming VGAM2287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78068] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2287 folded precursor RNA into VGAM2287 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2287 RNA is designated SEQ ID:4998, and is provided hereinbelow with reference to the sequence listing part.

[78069] VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2287 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78070] VGAM2287 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2287 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78071] The complementary binding of VGAM2287 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2287 host target RNA into VGAM2287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78072] It is appreciated that VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2287 host target genes. The mRNA of each one of this plurality of VGAM2287 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2287 RNA, herein designated VGAM RNA, and which when bound by VGAM2287 RNA causes inhibition of translation of respective one or more VGAM2287 host target proteins.

[78073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2287 gene, herein designated VGAM GENE, on one or more VGAM2287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78074] It is yet further appreciated that a function of VGAM2287 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2287 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2287 correlate with, and may be deduced from, the identity of the host target genes which VGAM2287 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78075] Nucleotide sequences of the VGAM2287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2287 are further described hereinbelow with reference to Table 1.

[78076] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2287 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2287 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[78077] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2287 gene, herein designated VGAM is inhibition of expression of VGAM2287 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2287 correlate with, and may be deduced from, the identity of the target genes which VGAM2287 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78078] FLJ13646 (Accession NM_024584) is a VGAM2287 host target gene. FLJ13646 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13646 BINDING SITE, designated SEQ ID:23811, to the nucleotide sequence of VGAM2287 RNA, herein designated VGAM RNA, also designated SEQ ID:4998.

[78079] A function of VGAM2287 is therefore inhibition of FLJ13646 (Accession NM_024584). Accordingly, utilities of VGAM2287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13646. KIAA1937 (Accession XM_057107) is another VGAM2287 host target gene. KIAA1937 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1937 BINDING SITE, designated SEQ ID:36482, to the nucleotide sequence of VGAM2287 RNA, herein designated VGAM RNA, also designated SEQ ID:4998.

[78080] Another function of VGAM2287 is therefore inhibition of KIAA1937 (Accession XM_057107). Accordingly, utilities of VGAM2287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1937. Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM_044799) is another VGAM2287 host target gene. NGEF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NGEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGEF BINDING SITE, designated SEQ ID:34275, to the nucleotide sequence of VGAM2287 RNA,

herein designated VGAM RNA, also designated SEQ ID:4998.

[78081] Another function of VGAM2287 is therefore inhibition of Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM_044799). Accordingly, utilities of VGAM2287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGEF. LOC152765 (Accession XM_087519) is another VGAM2287 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39318, to the nucleotide sequence of VGAM2287 RNA, herein designated VGAM RNA, also designated SEQ ID:4998.

[78082] Another function of VGAM2287 is therefore inhibition of LOC152765 (Accession XM_087519). Accordingly, utilities of VGAM2287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC255045 (Accession XM_171243) is another VGAM2287 host target gene. LOC255045 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255045 BINDING SITE, designated SEQ ID:46030, to the nucleotide sequence of VGAM2287 RNA, herein designated VGAM RNA, also designated SEQ ID:4998.

[78083] Another function of VGAM2287 is therefore inhibition of LOC255045 (Accession XM_171243). Accordingly, utilities of VGAM2287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255045. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2288 (VGAM2288) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78084] VGAM2288 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2288 was detected is described hereinabove with reference to Figs. 1-8.

[78085] VGAM2288 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78086] VGAM2288 gene encodes a VGAM2288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2288 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2288 precursor RNA is designated SEQ ID:2274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2274 is located at position 23052 relative to the genome of Murine Hepatitis Virus.

[78087] VGAM2288 precursor RNA folds onto itself, forming VGAM2288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[78088] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2288 folded precursor RNA into VGAM2288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2288 RNA is designated SEQ ID:4999, and is provided hereinbelow with reference to the sequence listing part.

[78089] VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2288 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78090] VGAM2288 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2288 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2288 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78091] The complementary binding of VGAM2288 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2288 host target RNA into VGAM2288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78092] It is appreciated that VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2288 host target genes. The mRNA of each one of this plurality of VGAM2288 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2288 RNA, herein designated VGAM RNA, and which when bound by VGAM2288 RNA causes inhibition of translation of respective one or more VGAM2288 host target proteins.

[78093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2288 gene, herein designated VGAM GENE, on one or more VGAM2288 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78094] It is yet further appreciated that a function of VGAM2288 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2288 correlate with, and may be deduced from, the identity of the host target genes which VGAM2288 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78095] Nucleotide sequences of the VGAM2288 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2288 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2288 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2288 are further described hereinbelow with reference to Table 1.

[78096] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2288 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78097] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2288 gene, herein designated VGAM is inhibition of expression of VGAM2288 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2288 correlate with, and may be deduced from, the identity of the target genes which VGAM2288 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78098] ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702) is a VGAM2288 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:6370, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78099] A function of VGAM2288 is therefore inhibition of ATPase, Na+/K+ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. HCA4 (Accession XM_085287) is another VGAM2288 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38027, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78100] Another function of VGAM2288 is therefore inhibition of HCA4 (Accession XM_085287). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HCA4. KIAA0247 (Accession NM_014734) is another VGAM2288 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16379, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78101] Another function of VGAM2288 is therefore inhibition of KIAA0247 (Accession NM_014734). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0319 (Accession NM_014809) is another VGAM2288 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16760, to the

nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78102] Another function of VGAM2288 is therefore inhibition of KIAA0319 (Accession NM_014809). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. KIAA0794 (Accession XM_087353) is another VGAM2288 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39185, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78103] Another function of VGAM2288 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. LOC153810 (Accession XM_087778) is another VGAM2288 host target gene. LOC153810 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC153810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153810 BINDING SITE, designated SEQ ID:39411, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78104] Another function of VGAM2288 is therefore inhibition of LOC153810 (Accession XM_087778). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153810. LOC253272 (Accession XM_170906) is another VGAM2288 host target gene. LOC253272 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253272 BINDING SITE, designated SEQ ID:45664, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78105] Another function of VGAM2288 is therefore inhibition of LOC253272 (Accession XM_170906). Accordingly, utilities

of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253272. LOC90643 (Accession XM_033145) is another VGAM2288 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90643 BINDING SITE, designated SEQ ID:31855, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78106] Another function of VGAM2288 is therefore inhibition of LOC90643 (Accession XM_033145). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90643. LOC93206 (Accession XM_049838) is another VGAM2288 host target gene. LOC93206 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC93206 BINDING SITE, designated SEQ ID:35518, to the nucleotide sequence of VGAM2288 RNA, herein designated VGAM RNA, also designated SEQ ID:4999.

[78107] Another function of VGAM2288 is therefore inhibition of LOC93206 (Accession XM_049838). Accordingly, utilities of VGAM2288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2289 (VGAM2289) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78108] VGAM2289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2289 was detected is described hereinabove with reference to Figs. 1-8.

[78109] VGAM2289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78110] VGAM2289 gene encodes a VGAM2289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2289 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2289 precursor RNA is designated SEQ ID:2275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2275 is located at position 12369 relative to the genome of Murine Hepatitis Virus.

[78111] VGAM2289 precursor RNA folds onto itself, forming VGAM2289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78112] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2289 folded precursor RNA into VGAM2289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2289 RNA is designated SEQ ID:5000, and is provided hereinbelow with reference to the sequence listing part.

[78113] VGAM2289 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2289 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78114] VGAM2289 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2289 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2289 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78115] The complementary binding of VGAM2289 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2289 host target RNA into VGAM2289 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78116] It is appreciated that VGAM2289 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2289 host target genes. The mRNA of each one of this plurality of VGAM2289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2289 RNA, herein designated VGAM RNA, and which when bound by VGAM2289 RNA causes inhibition of translation of respective one or more VGAM2289 host target proteins.

[78117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2289 gene, herein designated VGAM GENE, on one or more VGAM2289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78118] It is yet further appreciated that a function of VGAM2289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2289 correlate with, and may be deduced from, the identity of the host target genes which VGAM2289 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78119] Nucleotide sequences of the VGAM2289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2289 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2289 are further described hereinbelow with reference to Table 1.

[78120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2289 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78121] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2289 gene, herein designated VGAM is inhibition of expression of VGAM2289 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2289 correlate with, and may be deduced from, the identity of the target genes which VGAM2289 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78122] NORE1 (Accession NM_031437) is a VGAM2289 host target gene. NORE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NORE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NORE1 BINDING SITE, designated SEQ ID:25445, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78123] A function of VGAM2289 is therefore inhibition of NORE1

(Accession NM_031437), a gene which may modulate intracellular signal transduction pathways. Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NORE1. The function of NORE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.FLJ13117 (Accession NM_023071) is another VGAM2289 host target gene. FLJ13117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13117 BINDING SITE, designated SEQ ID:23327, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78124] Another function of VGAM2289 is therefore inhibition of FLJ13117 (Accession NM_023071). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13117. KIAA0212 (Accession NM_014674) is another

VGAM2289 host target gene. KIAA0212 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0212 BINDING SITE, designated SEQ ID:16143, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78125] Another function of VGAM2289 is therefore inhibition of KIAA0212 (Accession NM_014674). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0212. KIAA0982 (Accession NM_014023) is another VGAM2289 host target gene. KIAA0982 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0982 BINDING SITE, designated SEQ ID:15248, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78126] Another function of VGAM2289 is therefore inhibition of KIAA0982 (Accession NM_014023). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0982. KIAA1164 (Accession XM_045358) is another VGAM2289 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:34442, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78127] Another function of VGAM2289 is therefore inhibition of KIAA1164 (Accession XM_045358). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164. MGC13090 (Accession NM_032711) is another VGAM2289 host target gene. MGC13090 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13090, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13090 BINDING SITE, designated SEQ ID:26428, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78128] Another function of VGAM2289 is therefore inhibition of MGC13090 (Accession NM_032711). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13090. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM2289 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:21906, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78129] Another function of VGAM2289 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM2289 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975) is another VGAM2289 host target gene. PTK6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12601, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78130] Another function of VGAM2289 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. SB52 (Accession NM_138335) is another VGAM2289 host target gene. SB52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SB52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SB52 BINDING SITE, designated SEQ ID:28734, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78131] Another function of VGAM2289 is therefore inhibition of SB52 (Accession NM_138335). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SB52. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815) is another VGAM2289 host target gene. SLC5A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ ID:22393, to the nucleotide sequence of VGAM2289 RNA, herein designated VGAM RNA, also designated SEQ ID:5000.

[78132] Another function of VGAM2289 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815). Accordingly, utilities of VGAM2289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

SLC5A7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2290 (VGAM2290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78133] VGAM2290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2290 was detected is described hereinabove with reference to Figs. 1-8.

[78134] VGAM2290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2290 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78135] VGAM2290 gene encodes a VGAM2290 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2290 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2290 precursor RNA is designated SEQ ID:2276, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2276 is located at position 16166 relative to the genome of Murine Hepatitis Virus.

[78136] VGAM2290 precursor RNA folds onto itself, forming VGAM2290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78137] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2290 folded precursor RNA into VGAM2290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2290 RNA is designated SEQ ID:5001, and is provided hereinbelow with reference to the sequence listing part.

[78138] VGAM2290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2290 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78139] VGAM2290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2290 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2290 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78140] The complementary binding of VGAM2290 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2290 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2290 host target RNA into VGAM2290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78141] It is appreciated that VGAM2290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2290 host target genes. The mRNA of each one of this plurality of VGAM2290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2290 RNA, herein designated VGAM RNA, and which when bound by VGAM2290 RNA causes

inhibition of translation of respective one or more VGAM2290 host target proteins.

[78142] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2290 gene, herein designated VGAM GENE, on one or more VGAM2290 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78143] It is yet further appreciated that a function of VGAM2290 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2290 include diagnosis, prevention and

treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2290 correlate with, and may be deduced from, the identity of the host target genes which VGAM2290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78144] Nucleotide sequences of the VGAM2290 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2290 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2290 are further described hereinbelow with reference to Table 1.

[78145] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2290 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78146] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2290 gene, herein designated VGAM is inhibition of expression of VGAM2290 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2290 correlate with, and may be deduced from, the identity of the target genes which VGAM2290 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78147] FLJ13912 (Accession NM_022770) is a VGAM2290 host target gene. FLJ13912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13912 BINDING SITE, designated SEQ ID:23030, to the nucleotide sequence of VGAM2290 RNA, herein designated VGAM RNA, also designated SEQ ID:5001.

[78148] A function of VGAM2290 is therefore inhibition of FLJ13912 (Accession NM_022770). Accordingly, utilities of VGAM2290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13912. Junctional Adhesion Molecule 1 (JAM1, Accession NM_144503) is another VGAM2290 host target gene. JAM1 BINDING SITE1 and JAM1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of

mRNA encoded by JAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1 and JAM1 BINDING SITE2, designated SEQ ID:29338 and SEQ ID:29349 respectively, to the nucleotide sequence of VGAM2290 RNA, herein designated VGAM RNA, also designated SEQ ID:5001.

[78149] Another function of VGAM2290 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM_144503). Accordingly, utilities of VGAM2290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM_033392) is another VGAM2290 host target gene. MAPK8IP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK8IP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP3 BINDING SITE, designated SEQ ID:27219, to the nucleotide sequence of VGAM2290 RNA, herein designated VGAM RNA, also designated SEQ

ID:5001.

[78150] Another function of VGAM2290 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM_033392). Accordingly, utilities of VGAM2290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP3. Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575) is another VGAM2290 host target gene. OR2C3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OR2C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR2C3 BINDING SITE, designated SEQ ID:37178, to the nucleotide sequence of VGAM2290 RNA, herein designated VGAM RNA, also designated SEQ ID:5001.

[78151] Another function of VGAM2290 is therefore inhibition of Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575). Accordingly, utilities of VGAM2290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR2C3. Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10,

Accession NM_002714) is another VGAM2290 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:8576, to the nucleotide sequence of VGAM2290 RNA, herein designated VGAM RNA, also designated SEQ ID:5001.

[78152] Another function of VGAM2290 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714). Accordingly, utilities of VGAM2290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2291 (VGAM2291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78153] VGAM2291 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2291 was detected is described hereinabove with reference to Figs. 1-8.

[78154] VGAM2291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78155] VGAM2291 gene encodes a VGAM2291 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2291 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2291 precursor RNA is designated SEQ ID:2277, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2277 is located at position 15049 relative to the genome of Murine Hepatitis Virus.

[78156] VGAM2291 precursor RNA folds onto itself, forming VGAM2291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78157] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2291 folded precursor RNA into VGAM2291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2291 RNA is designated SEQ ID:5002, and is provided hereinbelow with reference to the sequence listing part.

[78158] VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2291 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78159] VGAM2291 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2291 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78160] The complementary binding of VGAM2291 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2291 host target RNA into VGAM2291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78161] It is appreciated that VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2291 host target genes. The mRNA of each one of this plurality of VGAM2291 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2291 RNA, herein designated VGAM RNA, and which when bound by VGAM2291 RNA causes inhibition of translation of respective one or more VGAM2291 host target proteins.

[78162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2291 gene, herein designated VGAM GENE, on one or more VGAM2291 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78163] It is yet further appreciated that a function of VGAM2291 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2291 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2291 correlate with, and may be deduced from, the identity of the host target genes which VGAM2291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78164] Nucleotide sequences of the VGAM2291 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2291 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2291 are further described hereinbelow with reference to Table 1.

[78165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2291 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2291 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78166] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2291 gene, herein designated VGAM is inhibition of expression of VGAM2291 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2291 correlate with, and may be deduced from, the identity of the target genes which VGAM2291 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78167] Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080) is a VGAM2291 host target gene. TRPM8 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:23515, to the nucleotide sequence of VGAM2291 RNA, herein designated VGAM RNA, also designated SEQ ID:5002.

[78168] A function of VGAM2291 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM2291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of TRPM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM201.Paired Mesoderm Homeobox 2b (PMX2B, Accession NM_003924) is another VGAM2291 host target gene. PMX2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PMX2B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX2B BINDING SITE, designated SEQ ID:10015, to the nucleotide sequence of VGAM2291 RNA, herein designated VGAM RNA, also designated SEQ ID:5002.

[78169] Another function of VGAM2291 is therefore inhibition of Paired Mesoderm Homeobox 2b (PMX2B, Accession NM_003924). Accordingly, utilities of VGAM2291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX2B. LOC130813 (Accession XM_065904) is another VGAM2291 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37309, to the nucleotide sequence of VGAM2291 RNA, herein designated VGAM RNA, also designated SEQ ID:5002.

[78170] Another function of VGAM2291 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities

of VGAM2291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC135818 (Accession XM_059804) is another VGAM2291 host target gene. LOC135818 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135818 BINDING SITE, designated SEQ ID:37092, to the nucleotide sequence of VGAM2291 RNA, herein designated VGAM RNA, also designated SEQ ID:5002.

[78171] Another function of VGAM2291 is therefore inhibition of LOC135818 (Accession XM_059804). Accordingly, utilities of VGAM2291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818. LOC196528 (Accession XM_113745) is another VGAM2291 host target gene. LOC196528 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196528 BINDING SITE, designated SEQ ID:42405, to the nucleotide sequence of VGAM2291 RNA, herein designated VGAM RNA, also designated SEQ ID:5002.

[78172] Another function of VGAM2291 is therefore inhibition of LOC196528 (Accession XM_113745). Accordingly, utilities of VGAM2291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196528. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2292 (VGAM2292) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78173] VGAM2292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2292 was detected is described hereinabove with reference to Figs. 1-8.

[78174] VGAM2292 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78175] VGAM2292 gene encodes a VGAM2292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2292 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2292 precursor RNA is designated SEQ ID:2278, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2278 is located at position 5645 relative to the genome of Murine Hepatitis Virus.

[78176] VGAM2292 precursor RNA folds onto itself, forming VGAM2292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78177] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2292 folded precursor RNA into VGAM2292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2292 RNA is designated SEQ ID:5003, and is provided hereinbelow with reference to the sequence listing part.

[78178] VGAM2292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2292 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78179] VGAM2292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2292 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78180] The complementary binding of VGAM2292 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2292 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2292 host target RNA into VGAM2292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78181] It is appreciated that VGAM2292 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2292 host target genes. The mRNA of each one of this plurality of VGAM2292 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2292 RNA, herein designated VGAM RNA, and which when bound by VGAM2292 RNA causes inhibition of translation of respective one or more VGAM2292 host target proteins.

[78182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2292 gene, herein designated VGAM GENE, on one or more VGAM2292 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78183] It is yet further appreciated that a function of VGAM2292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2292 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2292 correlate with, and may be deduced from, the identity of the host target genes which VGAM2292 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78184] Nucleotide sequences of the VGAM2292 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2292 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2292 are further described hereinbelow with reference to Table 1.

[78185] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2292 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78186] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2292 gene, herein designated VGAM is inhibition of expression of VGAM2292 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2292 correlate with, and may be deduced from, the identity of the target genes which VGAM2292 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78187] DKFZP564D0478 (Accession NM_032125) is a VGAM2292 host target gene. DKFZP564D0478 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D0478 BINDING SITE, designated SEQ ID:25811, to the nucleotide sequence of VGAM2292 RNA, herein designated VGAM RNA, also designated SEQ ID:5003.

[78188] A function of VGAM2292 is therefore inhibition of DK-

FZP564D0478 (Accession NM_032125). Accordingly, utilities of VGAM2292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0478. DKFZP566G1424 (Accession XM_097771) is another VGAM2292 host target gene. DKFZP566G1424 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566G1424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566G1424 BINDING SITE, designated SEQ ID:41118, to the nucleotide sequence of VGAM2292 RNA, herein designated VGAM RNA, also designated SEQ ID:5003.

[78189] Another function of VGAM2292 is therefore inhibition of DKFZP566G1424 (Accession XM_097771). Accordingly, utilities of VGAM2292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566G1424. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2293 (VGAM2293) viral gene, which modulates expression of respective host tar-

get genes thereof, the function and utility of which host target genes is known in the art.

[78190] VGAM2293 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2293 was detected is described hereinabove with reference to Figs. 1-8.

[78191] VGAM2293 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78192] VGAM2293 gene encodes a VGAM2293 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2293 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2293 precursor RNA is designated SEQ ID:2279, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2279 is located at position 25465 relative to the genome of Murine Hepatitis Virus.

[78193] VGAM2293 precursor RNA folds onto itself, forming VGAM2293 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78194] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2293 folded precursor RNA into VGAM2293 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM2293 RNA is designated SEQ ID:5004, and is provided hereinbelow with reference to the sequence listing part.

[78195] VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2293 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78196] VGAM2293 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2293 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2293 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78197] The complementary binding of VGAM2293 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2293 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2293 host target RNA into VGAM2293 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78198] It is appreciated that VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2293 host target genes. The mRNA of each one of this plurality of VGAM2293 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2293 RNA, herein designated VGAM RNA, and which when bound by VGAM2293 RNA causes inhibition of translation of respective one or more VGAM2293 host target proteins.

[78199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2293 gene, herein designated VGAM GENE, on one or more VGAM2293 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78200] It is yet further appreciated that a function of VGAM2293 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2293 correlate with, and may be deduced from, the identity of the host target genes which VGAM2293 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[78201] Nucleotide sequences of the VGAM2293 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2293 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2293 are further described hereinbelow with reference to Table 1.

[78202] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2293 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2293 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78203] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2293 gene, herein designated VGAM is inhibition of expression of VGAM2293 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2293 correlate with, and may be deduced from, the identity of the target genes which VGAM2293 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78204] Microtubule-associated Protein 1A (MAP1A, Accession NM_002373) is a VGAM2293 host target gene. MAP1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1A BINDING SITE, designated SEQ ID:8185, to the nucleotide sequence of VGAM2293 RNA, herein designated VGAM RNA, also designated SEQ ID:5004.

[78205] A function of VGAM2293 is therefore inhibition of Microtubule-associated Protein 1A (MAP1A, Accession NM_002373), a gene which is a structural protein involved in the filamentous cross- bridging between microtubules and other skeletal elements. Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1A. The function of MAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315.Villin 2 (ezrin) (VIL2, Accession NM_003379) is another VGAM2293 host target gene. VIL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by VIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIL2 BINDING SITE, designated SEQ ID:9410, to the nucleotide sequence of VGAM2293 RNA, herein designated VGAM RNA, also designated SEQ ID:5004.

[78206] Another function of VGAM2293 is therefore inhibition of Villin 2 (ezrin) (VIL2, Accession NM_003379), a gene which is involved in the formation of the immunological synapse and in T cell activation. Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIL2. The function of VIL2 has been established by previous studies. The immunologic synapse is the T cell-APC (antigen-presenting cell) contact site where T-cell receptors, coreceptors, signaling molecules, and adhesion receptors polarize upon antigen recognition. The formation of the immunologic synapse is thought to be important for receptor signal transduction and full T-lymphocyte activation. Using superantigen-stimulated Jurkat cells and confocal microscopy, Roumier et al. (2001) demonstrated that ezrin, F-actin (see OMIM Ref. No. ACTA1; 102610),

and CD43 (OMIM Ref. No. 182160) relocalize to the sides, not the center, of the T cell-APC contact area after T-cell activation, suggesting that ezrin may contribute to setting the scaffold between the actin cytoskeleton and transmembrane proteins facilitating cell-cell interactions and receptor retention. Using mouse helper T cell lines and confocal microscopy, Allenspach et al. (2001) determined that the cytoplasmic tail of CD43 is necessary and sufficient for CD43 removal from the immunologic synapse. In at least some cells, CD43 is located at the distal pole of the T cell together with ezrin and moesin. No differences in the behavior of ezrin and moesin were noted throughout the study. Using cells from Cd43 -/- mice, Allenspach et al. (2001) observed that ERM proteins move independently of the large CD43 mucin. Overexpression of a dominant-negative ERM mutant containing the N-terminal 320 amino acids of ezrin inhibited the activation-induced movement of CD43 without affecting conjugate formation. The dominant-negative mutant reduced cytokine production but not the expression of T-cell activation markers

[78207] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78208] Roumier, A.; Olivo-Marin, J. C.; Arpin, M.; Michel, F.; Martin, M.; Mangeat, P.; Acuto, O.; Dautry-Varsat, A.; Alcover, A. : The membrane-microfilament linker ezrin is involved in the formation of the immunological synapse and in T cell activation. Immunity 15: 715-728, 2001. ; and

[78209] Allenspach, E. J.; Cullinan, P.; Tong, J.; Tang, Q.; Tesciuba, A. G.; Cannon, J. L.; Takahashi, S. M.; Morgan, R.; Burkhardt, J. K.; Sperling, A. I. : ERM-dependent movement of CD43 defin.

[78210] Further studies establishing the function and utilities of VIL2 are found in John Hopkins OMIM database record ID 123900, and in sited publications numbered 4347-4355 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.ATP-binding Cassette, Sub-family A (ABC1), Member 10 (ABCA10, Accession NM_080282) is another VGAM2293 host target gene. ABCA10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABCA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA10 BINDING SITE, designated SEQ ID:27825, to the nucleotide sequence of VGAM2293 RNA,

herein designated VGAM RNA, also designated SEQ ID:5004.

[78211] Another function of VGAM2293 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 10 (ABCA10, Accession NM_080282). Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA10. Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312) is another VGAM2293 host target gene. C11orf23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf23 BINDING SITE, designated SEQ ID:20301, to the nucleotide sequence of VGAM2293 RNA, herein designated VGAM RNA, also designated SEQ ID:5004.

[78212] Another function of VGAM2293 is therefore inhibition of Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312). Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf23.

KIAA0472 (Accession XM_050147) is another VGAM2293 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35575, to the nucleotide sequence of VGAM2293 RNA, herein designated VGAM RNA, also designated SEQ ID:5004.

[78213] Another function of VGAM2293 is therefore inhibition of KIAA0472 (Accession XM_050147). Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA0847 (Accession XM_085298) is another VGAM2293 host target gene. KIAA0847 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0847 BINDING SITE, designated SEQ ID:38047, to the nucleotide sequence of VGAM2293 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5004.

[78214] Another function of VGAM2293 is therefore inhibition of KIAA0847 (Accession XM_085298). Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0847. LBP-9 (Accession NM_014553) is another VGAM2293 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15876, to the nucleotide sequence of VGAM2293 RNA, herein designated VGAM RNA, also designated SEQ ID:5004.

[78215] Another function of VGAM2293 is therefore inhibition of LBP-9 (Accession NM_014553). Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. LOC143914 (Accession XM_084654) is another VGAM2293 host target gene. LOC143914 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143914, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143914 BINDING SITE, designated SEQ ID:37634, to the nucleotide sequence of VGAM2293 RNA, herein designated VGAM RNA, also designated SEQ ID:5004.

[78216] Another function of VGAM2293 is therefore inhibition of LOC143914 (Accession XM_084654). Accordingly, utilities of VGAM2293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143914. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2294 (VGAM2294) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78217] VGAM2294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2294 was detected is described hereinabove with reference to Figs. 1-8.

[78218] VGAM2294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus.

VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78219] VGAM2294 gene encodes a VGAM2294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2294 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2294 precursor RNA is designated SEQ ID:2280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2280 is located at position 22784 relative to the genome of Murine Hepatitis Virus.

[78220] VGAM2294 precursor RNA folds onto itself, forming VGAM2294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78221] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2294 folded precursor RNA into VGAM2294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2294 RNA is designated SEQ ID:5005, and is provided hereinbelow with reference to the sequence listing part.

[78222] VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2294 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78223] VGAM2294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2294 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2294 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78224] The complementary binding of VGAM2294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2294 host target RNA into VGAM2294 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78225] It is appreciated that VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2294 host target genes. The mRNA of each one of this plurality of VGAM2294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2294 RNA, herein designated VGAM RNA, and which when bound by VGAM2294 RNA causes inhibition of translation of respective one or more VGAM2294 host target proteins.

[78226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2294 gene, herein designated VGAM GENE, on one or more VGAM2294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78227] It is yet further appreciated that a function of VGAM2294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2294 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM2294 correlate with, and may be deduced from, the identity of the host target genes which VGAM2294 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78228] Nucleotide sequences of the VGAM2294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2294 are further described hereinbelow with reference to Table 1.

[78229] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2294 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78230] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2294 gene, herein designated VGAM is inhibition of expression of VGAM2294 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2294 correlate with, and may be deduced from, the identity of the target genes which VGAM2294 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78231] A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM_033274) is a VGAM2294 host target gene. ADAM19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM19 BINDING SITE,

designated SEQ ID:27093, to the nucleotide sequence of VGAM2294 RNA, herein designated VGAM RNA, also designated SEQ ID:5005.

[78232] A function of VGAM2294 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM_033274), a gene which participates in the proteolytic processing of beta-type neuregulin isoforms . Accordingly, utilities of VGAM2294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM19. The function of ADAM19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.LOC92228 (Accession XM_043731) is another VGAM2294 host target gene. LOC92228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92228 BINDING SITE, designated SEQ ID:34002, to the nucleotide sequence of VGAM2294 RNA, herein designated VGAM RNA, also designated SEQ ID:5005.

[78233] Another function of VGAM2294 is therefore inhibition of LOC92228 (Accession XM_043731). Accordingly, utilities of VGAM2294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92228. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2295 (VGAM2295) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78234] VGAM2295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2295 was detected is described hereinabove with reference to Figs. 1-8.

[78235] VGAM2295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78236] VGAM2295 gene encodes a VGAM2295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2295 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2295 precursor RNA is designated SEQ ID:2281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2281 is located at position 43938 relative to the genome of Ectromelia Virus.

[78237] VGAM2295 precursor RNA folds onto itself, forming VGAM2295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78238] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2295 folded precursor RNA into VGAM2295 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2295 RNA is designated SEQ ID:5006, and is provided hereinbelow with reference to the sequence listing part.

[78239] VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2295 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78240] VGAM2295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2295 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2295 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78241] The complementary binding of VGAM2295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2295 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2295 host target RNA into VGAM2295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78242] It is appreciated that VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2295 host target genes. The mRNA of each one of this plurality of VGAM2295 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2295 RNA, herein designated VGAM RNA, and which when bound by VGAM2295 RNA causes inhibition of translation of respective one or more VGAM2295 host target proteins.

[78243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2295 gene, herein designated VGAM GENE, on one or more VGAM2295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78244] It is yet further appreciated that a function of VGAM2295 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2295 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2295 correlate with, and may be deduced from, the identity of the host target genes which VGAM2295 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78245] Nucleotide sequences of the VGAM2295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2295 are further described hereinbelow with reference to Table 1.

[78246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2295 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2295 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[78247] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2295 gene, herein designated VGAM is inhibition of expression of VGAM2295 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2295 correlate with, and may be deduced from, the identity of the target genes which VGAM2295 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78248] TAF9 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 32kDa (TAF9, Accession NM_003187) is a VGAM2295 host target gene. TAF9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TAF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9 BINDING SITE, designated SEQ ID:9163, to the nucleotide sequence of VGAM2295 RNA, herein designated VGAM RNA, also designated SEQ ID:5006.

[78249] A function of VGAM2295 is therefore inhibition of TAF9 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 32kDa (TAF9, Accession

NM_003187), a gene which may function as a coactivator of transcription. Accordingly, utilities of VGAM2295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9. The function of TAF9 has been established by previous studies. Klemm et al. (1995) cloned a human TFIID subunit, which they termed hTAFII32. The 32-kD protein was isolated from HeLa cell nuclear extracts and partially sequenced. A degenerate oligomer was designed and used to probe a human HeLa cell cDNA library. The identified cDNA has a deduced amino acid sequence of 264 residues and is related to the Drosophila TAFII40. Klemm et al. (1995) showed that TAFII32 interacts with GTF2B (OMIM Ref. No. 189963) and with the viral transcriptional transactivator VP16. The authors showed that recombinantly expressed TAFII32 was functional in a partial recombinant TFIID complex and that the recombinant complex mediated activation by a GAL4-VP16 fusion protein. Lu and Levine (1995) cloned TAF9, which they called TAFII31. TAF9 encodes a 264-amino acid protein. Immunoprecipitation and binding analyses showed interaction of TAF9 with the N-terminal domain of p53 (OMIM Ref. No. 191170) at sites identical to those bound by MDM2 (OMIM Ref. No. 164785), the

major cellular negative regulator of p53 activity. Antibodies to TAF9 inhibited p53-activated transcription. Lu and Levine (1995) concluded that p53 activity is regulated by 2 proteins competing for the same region of the p53 protein.

[78250] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78251] Klemm, R. D.; Goodrich, J. A.; Zhou, S.; Tjian, R. : Molecular cloning and expression of the 32-kDa subunit of human TFIID reveals interactions with VP16 and TFIIB that mediate transcriptional activation. Proc. Nat. Acad. Sci. 92: 5788-5792, 1995. ; and

[78252] Lu, H.; Levine, A. J. : Human TAFII31 protein is a transcriptional coactivator of the p53 protein. Proc. Nat. Acad. Sci. 92: 5154-5158, 1995.

[78253] Further studies establishing the function and utilities of TAF9 are found in John Hopkins OMIM database record ID 600822, and in sited publications numbered 7536-7538 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.KIAA1866 (Accession XM_027658) is another VGAM2295 host target gene. KIAA1866 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by KIAA1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1866 BINDING SITE, designated SEQ ID:30554, to the nucleotide sequence of VGAM2295 RNA, herein designated VGAM RNA, also designated SEQ ID:5006.

[78254] Another function of VGAM2295 is therefore inhibition of KIAA1866 (Accession XM_027658). Accordingly, utilities of VGAM2295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1866. LOC200269 (Accession XM_114175) is another VGAM2295 host target gene. LOC200269 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200269, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200269 BINDING SITE, designated SEQ ID:42757, to the nucleotide sequence of VGAM2295 RNA, herein designated VGAM RNA, also designated SEQ ID:5006.

[78255] Another function of VGAM2295 is therefore inhibition of

LOC200269 (Accession XM_114175). Accordingly, utilities of VGAM2295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200269. LOC255461 (Accession XM_173207) is another VGAM2295 host target gene. LOC255461 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255461 BINDING SITE, designated SEQ ID:46461, to the nucleotide sequence of VGAM2295 RNA, herein designated VGAM RNA, also designated SEQ ID:5006.

[78256] Another function of VGAM2295 is therefore inhibition of LOC255461 (Accession XM_173207). Accordingly, utilities of VGAM2295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255461. LOC255516 (Accession XM_173212) is another VGAM2295 host target gene. LOC255516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC255516 BINDING SITE, designated SEQ ID:46467, to the nucleotide sequence of VGAM2295 RNA, herein designated VGAM RNA, also designated SEQ ID:5006.

[78257] Another function of VGAM2295 is therefore inhibition of LOC255516 (Accession XM_173212). Accordingly, utilities of VGAM2295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255516. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2296 (VGAM2296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78258] VGAM2296 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2296 was detected is described hereinabove with reference to Figs. 1-8.

[78259] VGAM2296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[78260] VGAM2296 gene encodes a VGAM2296 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2296 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2296 precursor RNA is designated SEQ ID:2282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2282 is located at position 27612 relative to the genome of Ectromelia Virus.

[78261] VGAM2296 precursor RNA folds onto itself, forming VGAM2296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78262] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2296 folded precursor RNA into VGAM2296 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2296 RNA is designated SEQ ID:5007, and is provided hereinbelow with reference to the sequence listing part.

[78263] VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2296 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78264] VGAM2296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2296 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78265] The complementary binding of VGAM2296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2296 host target RNA into VGAM2296 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78266] It is appreciated that VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2296 host target genes. The mRNA of each one of this plurality of VGAM2296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2296 RNA, herein designated VGAM RNA, and which when bound by VGAM2296 RNA causes inhibition of translation of respective one or more VGAM2296 host target proteins.

[78267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2296 gene, herein designated VGAM GENE, on one or more VGAM2296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78268] It is yet further appreciated that a function of VGAM2296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2296 correlate with, and may be deduced from, the identity of the host target genes which VGAM2296 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78269] Nucleotide sequences of the VGAM2296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2296 are further described hereinbelow with reference to Table 1.

[78270] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2296 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78271] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2296 gene, herein designated VGAM is inhibition of expression of VGAM2296 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2296 correlate with, and may be deduced from, the identity of the target genes which VGAM2296 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78272] Cadherin 11, Type 2, OB-cadherin (osteoblast) (CDH11, Accession NM_033664) is a VGAM2296 host target gene. CDH11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH11 BINDING SITE, designated SEQ ID:27392, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ

ID:5007.

[78273] A function of VGAM2296 is therefore inhibition of Cadherin 11, Type 2, OB-cadherin (osteoblast) (CDH11, Accession NM_033664), a gene which plays an role in development and maintenance of tissues. Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH11. The function of CDH11 has been established by previous studies. Cadherins are a group of cell surface glycoproteins that mediate Ca(2+)-dependent cell-cell adhesion (Tanihara et al., 1994). These proteins have a molecular mass of about 120 kD and are composed of an extracellular domain at the N-terminal end and a relatively small cytoplasmic domain at the C-terminal end; the 2 domains are connected by a single membrane-spanning sequence. The extracellular domain consists of 5 subdomains, each of which contains a cadherin-specific motif. Cadherin expression is regulated spatially as well as temporally. Cadherins are thought to play an important role in development and maintenance of tissues through selective cell-cell adhesion activity and may be involved also in the invasion and metastasis of malignant tumors. Okazaki et al. (1994) identified a new member of the cadherin

family, which they called OB (osteoblast)-cadherin, in a mouse osteoblastic cell line and human osteosarcoma. OB-cadherin was also weakly expressed in stroma cell lines that are the progenitor cells of osteoblasts. Expression of the CDHOB gene in the osteoblastic cell line was up-regulated during differentiation, suggesting a specific function in bone cell differentiation and bone formation. Two different forms of human OB-cadherin cDNA were cloned; one was a counterpart of the mouse gene and the other encoded a protein with a truncated cytoplasmic domain. The protein was designated cadherin-11 (symbol: CDH11) by the Human Genome Nomenclature Committee.

[78274] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78275] Kools, P.; Vanhalst, K.; Wan den Eynde, E.; van Roy, F. : The human cadherin-10 gene: complete coding sequence, predominant expression in the brain and mapping on chromosome 5p13-13. FEBS Lett. 452: 328-334, 1999. ; and

[78276] Suzuki, S.; Sano, K.; Tanihara, H. : Diversity of the cadherin family: evidence for eight new cadherins in nervous tissue. Cell Regul. 2: 261-270, 1991.

[78277] Further studies establishing the function and utilities of CDH11 are found in John Hopkins OMIM database record ID 600023, and in sited publications numbered 833 and 11646-8336 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Enolase 2, (gamma, neuronal) (ENO2, Accession NM_001975) is another VGAM2296 host target gene. ENO2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ENO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENO2 BINDING SITE, designated SEQ ID:7704, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78278] Another function of VGAM2296 is therefore inhibition of Enolase 2, (gamma, neuronal) (ENO2, Accession NM_001975), a gene which converts 2-phospho-D-glycerate to phosphoenolpyruvate in glycolysis. Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENO2. The function of ENO2 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM1151.Klotho (KL, Accession NM_004795) is another VGAM2296 host target gene. KL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KL BINDING SITE, designated SEQ ID:11203, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78279] Another function of VGAM2296 is therefore inhibition of Klotho (KL, Accession NM_004795), a gene which has similarity to beta-glucosidases. Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KL. The function of KL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1730.Claudin 1 (CLDN1, Accession NM_021101) is another VGAM2296 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLDN1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:22079, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78280] Another function of VGAM2296 is therefore inhibition of Claudin 1 (CLDN1, Accession NM_021101). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM2296 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:28918 and SEQ ID:17398 respectively, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78281] Another function of VGAM2296 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. KIAA0323 (Accession XM_032634) is another VGAM2296 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31694, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78282] Another function of VGAM2296 is therefore inhibition of KIAA0323 (Accession XM_032634). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA1582 (Accession XM_037262) is another VGAM2296 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32585, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78283] Another function of VGAM2296 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. phorbolin-1 (Accession XM_114206) is another VGAM2296 host target gene. phorbolin-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by phorbolin-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phorbolin-1 BINDING SITE, designated SEQ ID:42797, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78284] Another function of VGAM2296 is therefore inhibition of phorbolin-1 (Accession XM_114206). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with phorbolin-1. Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950) is another VGAM2296 host target gene. PRRG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:6654, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78285] Another function of VGAM2296 is therefore inhibition of Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1. Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627) is another VGAM2296 host target gene. TREX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TREX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE, designated SEQ ID:27339, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78286] Another function of VGAM2296 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. LOC219653 (Accession XM_166093) is another VGAM2296 host target gene. LOC219653 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219653 BINDING SITE, designated SEQ ID:43866, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78287] Another function of VGAM2296 is therefore inhibition of LOC219653 (Accession XM_166093). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219653. LOC51285 (Accession NM_016563) is another VGAM2296 host target gene. LOC51285 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51285 BINDING SITE, designated SEQ ID:18635, to the nucleotide sequence of VGAM2296 RNA, herein designated VGAM RNA, also designated SEQ ID:5007.

[78288] Another function of VGAM2296 is therefore inhibition of LOC51285 (Accession NM_016563). Accordingly, utilities of VGAM2296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51285. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2297 (VGAM2297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78289] VGAM2297 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2297 was detected is described hereinabove with reference to Figs. 1-8.

[78290] VGAM2297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78291] VGAM2297 gene encodes a VGAM2297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2297 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2297 precursor RNA is designated SEQ ID:2283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2283 is located at position 28555 relative to the genome of Ectromelia Virus.

[78292] VGAM2297 precursor RNA folds onto itself, forming VGAM2297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78293] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2297 folded precursor RNA into VGAM2297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2297 RNA is designated SEQ ID:5008, and is provided hereinbelow with reference to the sequence listing part.

[78294] VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2297 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78295] VGAM2297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2297 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78296] The complementary binding of VGAM2297 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2297 host target RNA into VGAM2297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78297] It is appreciated that VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2297 host target genes. The mRNA of each one of this plurality of VGAM2297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2297 RNA, herein designated VGAM RNA, and which when bound by VGAM2297 RNA causes inhibition of translation of respective one or more VGAM2297 host target proteins.

[78298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2297 gene, herein designated VGAM GENE, on one or more VGAM2297 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78299] It is yet further appreciated that a function of VGAM2297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2297 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2297 correlate with, and may be deduced from, the identity of the host target genes which VGAM2297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78300] Nucleotide sequences of the VGAM2297 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2297 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2297 are further described hereinbelow with reference to Table 1.

[78301] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2297 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2297 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78302] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2297 gene, herein designated VGAM is inhibition of expression of VGAM2297 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2297 correlate with, and may be deduced from, the identity of the target genes which VGAM2297 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78303] Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315) is a VGAM2297 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3 are HOST

TARGET binding sites found in untranslated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3, designated SEQ ID:7005, SEQ ID:29109 and SEQ ID:29116 respectively, to the nucleotide sequence of VGAM2297 RNA, herein designated VGAM RNA, also designated SEQ ID:5008.

[78304] A function of VGAM2297 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315), a gene which is important for cytokine production; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM2297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.FLJ25415 (Accession NM_144708) is another VGAM2297 host target gene. FLJ25415 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ25415, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25415 BINDING SITE, designated SEQ ID:29532, to the nucleotide sequence of VGAM2297 RNA, herein designated VGAM RNA, also designated SEQ ID:5008.

[78305] Another function of VGAM2297 is therefore inhibition of FLJ25415 (Accession NM_144708). Accordingly, utilities of VGAM2297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25415. PRO2032 (Accession NM_018615) is another VGAM2297 host target gene. PRO2032 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2032 BINDING SITE, designated SEQ ID:20686, to the nucleotide sequence of VGAM2297 RNA, herein designated VGAM RNA, also designated SEQ ID:5008.

[78306] Another function of VGAM2297 is therefore inhibition of PRO2032 (Accession NM_018615). Accordingly, utilities of VGAM2297 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO2032. PRO2730 (Accession NM_025222) is another VGAM2297 host target gene. PRO2730 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2730 BINDING SITE, designated SEQ ID:24899, to the nucleotide sequence of VGAM2297 RNA, herein designated VGAM RNA, also designated SEQ ID:5008.

[78307] Another function of VGAM2297 is therefore inhibition of PRO2730 (Accession NM_025222). Accordingly, utilities of VGAM2297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2730. LOC149830 (Accession XM_097746) is another VGAM2297 host target gene. LOC149830 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149830 BINDING SITE, designated SEQ ID:41094, to

the nucleotide sequence of VGAM2297 RNA, herein designated VGAM RNA, also designated SEQ ID:5008.

[78308] Another function of VGAM2297 is therefore inhibition of LOC149830 (Accession XM_097746). Accordingly, utilities of VGAM2297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149830. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2298 (VGAM2298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78309] VGAM2298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2298 was detected is described hereinabove with reference to Figs. 1-8.

[78310] VGAM2298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78311] VGAM2298 gene encodes a VGAM2298 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2298 precursor RNA is designated SEQ ID:2284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2284 is located at position 32155 relative to the genome of Ectromelia Virus.

[78312] VGAM2298 precursor RNA folds onto itself, forming VGAM2298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78313] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2298 folded precursor RNA into VGAM2298 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2298 RNA is designated SEQ ID:5009, and is provided hereinbelow with reference to the sequence listing part.

[78314] VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2298 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78315] VGAM2298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2298 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78316] The complementary binding of VGAM2298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2298 host target RNA into VGAM2298 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78317] It is appreciated that VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2298 host target genes. The mRNA of each one of this plurality of VGAM2298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2298 RNA, herein designated VGAM RNA, and which when bound by VGAM2298 RNA causes inhibition of translation of respective one or more VGAM2298 host target proteins.

[78318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2298 gene, herein designated VGAM GENE, on one or more VGAM2298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78319] It is yet further appreciated that a function of VGAM2298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2298 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2298 correlate with, and may be deduced from, the identity of the host target genes which VGAM2298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78320] Nucleotide sequences of the VGAM2298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2298 are further described hereinbelow with reference to Table 1.

[78321] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2298 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78322] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2298 gene, herein designated VGAM is inhibition of expression of VGAM2298 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2298 correlate with, and may be deduced from, the identity of the target genes which VGAM2298 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78323] FK506 Binding Protein 14, 22 KDa (FKBP14, Accession NM_017946) is a VGAM2298 host target gene. FKBP14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP14 BINDING SITE, designated SEQ ID:19643, to the nucleotide sequence of VGAM2298 RNA, herein designated VGAM RNA, also designated SEQ ID:5009.

[78324] A function of VGAM2298 is therefore inhibition of FK506 Binding Protein 14, 22 KDa (FKBP14, Accession

NM_017946). Accordingly, utilities of VGAM2298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP14. MDS028 (Accession NM_018463) is another VGAM2298 host target gene. MDS028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MDS028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS028 BINDING SITE, designated SEQ ID:20533, to the nucleotide sequence of VGAM2298 RNA, herein designated VGAM RNA, also designated SEQ ID:5009.

[78325] Another function of VGAM2298 is therefore inhibition of MDS028 (Accession NM_018463). Accordingly, utilities of VGAM2298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS028. LOC203429 (Accession XM_114701) is another VGAM2298 host target gene. LOC203429 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC203429 BINDING SITE, designated SEQ ID:43047, to the nucleotide sequence of VGAM2298 RNA, herein designated VGAM RNA, also designated SEQ ID:5009.

[78326] Another function of VGAM2298 is therefore inhibition of LOC203429 (Accession XM_114701). Accordingly, utilities of VGAM2298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203429. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2299 (VGAM2299) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78327] VGAM2299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2299 was detected is described hereinabove with reference to Figs. 1-8.

[78328] VGAM2299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[78329] VGAM2299 gene encodes a VGAM2299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2299 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2299 precursor RNA is designated SEQ ID:2285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2285 is located at position 23346 relative to the genome of Ectromelia Virus.

[78330] VGAM2299 precursor RNA folds onto itself, forming VGAM2299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78331] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2299 folded precursor RNA into VGAM2299 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2299 RNA is designated SEQ ID:5010, and is provided hereinbelow with reference to the sequence listing part.

[78332] VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2299 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78333] VGAM2299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2299 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78334] The complementary binding of VGAM2299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2299 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2299 host target RNA into VGAM2299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78335] It is appreciated that VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2299 host target genes. The mRNA of each one of this plurality of VGAM2299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2299 RNA, herein designated VGAM RNA, and which when bound by VGAM2299 RNA causes inhibition of translation of respective one or more VGAM2299 host target proteins.

[78336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2299 gene, herein designated VGAM GENE, on one or more VGAM2299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78337] It is yet further appreciated that a function of VGAM2299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2299 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2299 correlate with, and may be deduced from, the identity of the host target genes which VGAM2299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78338] Nucleotide sequences of the VGAM2299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2299 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2299 are further described hereinbelow with reference to Table 1.

[78339] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2299 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78340] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2299 gene, herein designated VGAM is inhibition of expression of VGAM2299 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2299 correlate with, and may be deduced from, the identity of the target genes which VGAM2299 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78341] TYRO3 Protein Tyrosine Kinase (TYRO3, Accession NM_006293) is a VGAM2299 host target gene. TYRO3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TYRO3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TYRO3 BINDING SITE, designated SEQ ID:12983, to the nucleotide sequence of VGAM2299 RNA, herein designated VGAM RNA, also designated SEQ ID:5010.

[78342] A function of VGAM2299 is therefore inhibition of TYRO3 Protein Tyrosine Kinase (TYRO3, Accession NM_006293), a gene which may be involved in cell adhesion processes, particularly in the central nervous system. Accordingly, utilities of VGAM2299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TYRO3. The function of TYRO3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM711.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2300 (VGAM2300) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78343] VGAM2300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2300 was detected is described hereinabove with reference to Figs. 1-8.

[78344] VGAM2300 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2300 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[78345] VGAM2300 gene encodes a VGAM2300 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2300 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2300 precursor RNA is designated SEQ ID:2286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2286 is located at position 38978 relative to the genome of Ectromelia Virus.

[78346] VGAM2300 precursor RNA folds onto itself, forming VGAM2300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78347] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2300 folded precursor RNA into VGAM2300

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2300 RNA is designated SEQ ID:5011, and is provided hereinbelow with reference to the sequence listing part.

[78348] VGAM2300 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2300 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78349] VGAM2300 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2300 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2300 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78350] The complementary binding of VGAM2300 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2300 host target RNA into VGAM2300 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[78351] It is appreciated that VGAM2300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2300 host target genes. The mRNA of each one of this plurality of VGAM2300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2300 RNA, herein designated VGAM RNA, and which when bound by VGAM2300 RNA causes inhibition of translation of respective one or more VGAM2300 host target proteins.

[78352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2300 gene, herein designated VGAM GENE, on one or more VGAM2300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78353] It is yet further appreciated that a function of VGAM2300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2300 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2300 correlate with, and may be deduced from, the identity of the host target genes which VGAM2300 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78354] Nucleotide sequences of the VGAM2300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2300 are further described hereinbelow with reference to Table 1.

[78355] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2300 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78356] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2300 gene, herein designated VGAM is inhibition of expression of VGAM2300 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2300 correlate with, and may be deduced from, the identity of the target genes which VGAM2300 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78357] RAD17 Homolog (S. pombe) (RAD17, Accession NM_002873) is a VGAM2300 host target gene. RAD17 BINDING SITE1 through RAD17 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD17, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD17 BINDING SITE1 through RAD17 BINDING SITE6, designated SEQ ID:8783,

SEQ ID:28480, SEQ ID:28484, SEQ ID:28486, SEQ ID:28488 and SEQ ID:28490 respectively, to the nucleotide sequence of VGAM2300 RNA, herein designated VGAM RNA, also designated SEQ ID:5011.

[78358] A function of VGAM2300 is therefore inhibition of RAD17 Homolog (S. pombe) (RAD17, Accession NM_002873), a gene which may have a role in DNA damage-dependent and DNA replication-dependent cell cycle checkpoints. Accordingly, utilities of VGAM2300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD17. The function of RAD17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209.Testis-specific Transcript, Y-linked 2 (TTTY2, Accession XM_099029) is another VGAM2300 host target gene. TTTY2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TTTY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTTY2 BINDING SITE, designated SEQ ID:42071, to the nucleotide sequence of VGAM2300 RNA,

herein designated VGAM RNA, also designated SEQ ID:5011.

[78359] Another function of VGAM2300 is therefore inhibition of Testis-specific Transcript, Y-linked 2 (TTTY2, Accession XM_099029). Accordingly, utilities of VGAM2300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY2. LOC149606 (Accession XM_086600) is another VGAM2300 host target gene. LOC149606 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:38783, to the nucleotide sequence of VGAM2300 RNA, herein designated VGAM RNA, also designated SEQ ID:5011.

[78360] Another function of VGAM2300 is therefore inhibition of LOC149606 (Accession XM_086600). Accordingly, utilities of VGAM2300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606. LOC159148 (Accession XM_099030) is another VGAM2300 host target gene. LOC159148 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159148 BINDING SITE, designated SEQ ID:42078, to the nucleotide sequence of VGAM2300 RNA, herein designated VGAM RNA, also designated SEQ ID:5011.

[78361] Another function of VGAM2300 is therefore inhibition of LOC159148 (Accession XM_099030). Accordingly, utilities of VGAM2300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159148. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2301 (VGAM2301) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78362] VGAM2301 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2301 was detected is described hereinabove with reference to Figs. 1-8.

[78363] VGAM2301 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78364] VGAM2301 gene encodes a VGAM2301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2301 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2301 precursor RNA is designated SEQ ID:2287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2287 is located at position 30387 relative to the genome of Ectromelia Virus.

[78365] VGAM2301 precursor RNA folds onto itself, forming VGAM2301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[78366] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2301 folded precursor RNA into VGAM2301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2301 RNA is designated SEQ ID:5012, and is provided hereinbelow with reference to the sequence listing part.

[78367] VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2301 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78368] VGAM2301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2301 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2301 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2301 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78369] The complementary binding of VGAM2301 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2301 host target RNA into VGAM2301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78370] It is appreciated that VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2301 host target genes. The mRNA of each one of this plurality of VGAM2301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2301 RNA, herein designated VGAM RNA, and which when bound by VGAM2301 RNA causes inhibition of translation of respective one or more VGAM2301 host target proteins.

[78371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2301 gene, herein designated VGAM GENE, on one or more VGAM2301 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78372] It is yet further appreciated that a function of VGAM2301 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2301 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2301 correlate with, and may be deduced from, the identity of the host target genes which VGAM2301 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78373] Nucleotide sequences of the VGAM2301 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2301 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2301 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2301 are further described hereinbelow with reference to Table 1.

[78374] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2301 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2301 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78375] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2301 gene, herein designated VGAM is inhibition of expression of VGAM2301 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2301 correlate with, and may be deduced from, the identity of the target genes which VGAM2301 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78376] Ankyrin Repeat Domain 6 (ANKRD6, Accession NM_014942) is a VGAM2301 host target gene. ANKRD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANKRD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of ANKRD6 BINDING SITE, designated SEQ ID:17252, to the nucleotide sequence of VGAM2301 RNA, herein designated VGAM RNA, also designated SEQ ID:5012.

[78377] A function of VGAM2301 is therefore inhibition of Ankyrin Repeat Domain 6 (ANKRD6, Accession NM_014942). Accordingly, utilities of VGAM2301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKRD6. DKFZP564O1863 (Accession XM_043922) is another VGAM2301 host target gene. DKFZP564O1863 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O1863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O1863 BINDING SITE, designated SEQ ID:34044, to the nucleotide sequence of VGAM2301 RNA, herein designated VGAM RNA, also designated SEQ ID:5012.

[78378] Another function of VGAM2301 is therefore inhibition of DKFZP564O1863 (Accession XM_043922). Accordingly, utilities of VGAM2301 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP564O1863. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2302 (VGAM2302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78379] VGAM2302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2302 was detected is described hereinabove with reference to Figs. 1-8.

[78380] VGAM2302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78381] VGAM2302 gene encodes a VGAM2302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2302 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2302 precursor RNA is desig-

nated SEQ ID:2288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2288 is located at position 44731 relative to the genome of Ectromelia Virus.

[78382] VGAM2302 precursor RNA folds onto itself, forming VGAM2302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78383] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2302 folded precursor RNA into VGAM2302 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2302 RNA is designated SEQ ID:5013, and is provided hereinbelow with reference to the sequence

listing part.

[78384] VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2302 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78385] VGAM2302 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2302 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2302 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78386] The complementary binding of VGAM2302 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2302 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2302 host target RNA into VGAM2302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78387] It is appreciated that VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2302 host target genes. The mRNA of each one of this plurality of VGAM2302 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2302 RNA, herein designated VGAM

RNA, and which when bound by VGAM2302 RNA causes inhibition of translation of respective one or more VGAM2302 host target proteins.

[78388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2302 gene, herein designated VGAM GENE, on one or more VGAM2302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78389] It is yet further appreciated that a function of VGAM2302 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2302 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2302 correlate with, and may be deduced from, the identity of the host target genes which VGAM2302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78390] Nucleotide sequences of the VGAM2302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2302 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2302 are further described hereinbelow with reference to Table 1.

[78391] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2302 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78392] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2302 gene, herein designated VGAM is

inhibition of expression of VGAM2302 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2302 correlate with, and may be deduced from, the identity of the target genes which VGAM2302 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78393] Carbonic Anhydrase XII (CA12, Accession NM_001218) is a VGAM2302 host target gene. CA12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CA12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA12 BINDING SITE, designated SEQ ID:6881, to the nucleotide sequence of VGAM2302 RNA, herein designated VGAM RNA, also designated SEQ ID:5013.

[78394] A function of VGAM2302 is therefore inhibition of Carbonic Anhydrase XII (CA12, Accession NM_001218), a gene which functions in cellular transport and metabolic processes. Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA12. The function of CA12 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM508.Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM_035453) is another VGAM2302 host target gene. CLASP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLASP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP2 BINDING SITE, designated SEQ ID:32270, to the nucleotide sequence of VGAM2302 RNA, herein designated VGAM RNA, also designated SEQ ID:5013.

[78395] Another function of VGAM2302 is therefore inhibition of Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM_035453), a gene which is involved in the regional regulation of microtubule dynamics in motile fibroblasts. Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP2. The function of CLASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM897.Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782) is another VGAM2302 host target gene. CYP24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP24 BINDING SITE, designated SEQ ID:6427, to the nucleotide sequence of VGAM2302 RNA, herein designated VGAM RNA, also designated SEQ ID:5013.

[78396] Another function of VGAM2302 is therefore inhibition of Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782), a gene which induces the differentiation of promyelocytes into monocytes/macrophages. Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP24. The function of CYP24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1204.G Protein-coupled Receptor 48 (GPR48, Accession NM_018490) is another VGAM2302 host target

gene. GPR48 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPR48, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR48 BINDING SITE, designated SEQ ID:20549, to the nucleotide sequence of VGAM2302 RNA, herein designated VGAM RNA, also designated SEQ ID:5013.

[78397] Another function of VGAM2302 is therefore inhibition of G Protein-coupled Receptor 48 (GPR48, Accession NM_018490), a gene which binds to follicle-stimulating hormone and thyroid-stimulating hormone. Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR48. The function of GPR48 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM376.Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020472) is another VGAM2302 host target gene. PIGA BINDING SITE1 and PIGA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions

of mRNA encoded by PIGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGA BINDING SITE1 and PIGA BINDING SITE2, designated SEQ ID:21710 and SEQ ID:21717 respectively, to the nucleotide sequence of VGAM2302 RNA, herein designated VGAM RNA, also designated SEQ ID:5013.

[78398] Another function of VGAM2302 is therefore inhibition of Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020472). Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGA. Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820) is another VGAM2302 host target gene. TOMM70A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOMM70A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:16787, to the nucleotide sequence of VGAM2302 RNA,

herein designated VGAM RNA, also designated SEQ ID:5013.

[78399] Another function of VGAM2302 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820). Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM70A. LOC145815 (Accession XM_096874) is another VGAM2302 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40606, to the nucleotide sequence of VGAM2302 RNA, herein designated VGAM RNA, also designated SEQ ID:5013.

[78400] Another function of VGAM2302 is therefore inhibition of LOC145815 (Accession XM_096874). Accordingly, utilities of VGAM2302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2303 (VGAM2303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78401] VGAM2303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2303 was detected is described hereinabove with reference to Figs. 1-8.

[78402] VGAM2303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78403] VGAM2303 gene encodes a VGAM2303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2303 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2303 precursor RNA is designated SEQ ID:2289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2289 is located at position 38706 relative to the genome of Ectromelia Virus.

[78404] VGAM2303 precursor RNA folds onto itself, forming VGAM2303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78405] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2303 folded precursor RNA into VGAM2303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2303 RNA is designated SEQ ID:5014, and is provided hereinbelow with reference to the sequence listing part.

[78406] VGAM2303 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2303 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78407] VGAM2303 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2303 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2303 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78408] The complementary binding of VGAM2303 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2303 host target RNA into VGAM2303 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78409] It is appreciated that VGAM2303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2303 host target genes. The mRNA of each one of this plurality of VGAM2303 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2303 RNA, herein designated VGAM RNA, and which when bound by VGAM2303 RNA causes inhibition of translation of respective one or more

VGAM2303 host target proteins.

[78410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2303 gene, herein designated VGAM GENE, on one or more VGAM2303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78411] It is yet further appreciated that a function of VGAM2303 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2303 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific

functions, and accordingly utilities, of VGAM2303 correlate with, and may be deduced from, the identity of the host target genes which VGAM2303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78412] Nucleotide sequences of the VGAM2303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2303 are further described hereinbelow with reference to Table 1.

[78413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2303 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2303 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78414] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2303 gene, herein designated VGAM is inhibition of expression of VGAM2303 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2303 correlate with, and may be deduced from, the identity of the target genes which VGAM2303 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78415] Actinin, Alpha 2 (ACTN2, Accession NM_001103) is a VGAM2303 host target gene. ACTN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTN2 BINDING SITE, designated SEQ ID:6757, to the nucleotide sequence of VGAM2303 RNA, herein designated VGAM RNA, also designated SEQ ID:5014.

[78416] A function of VGAM2303 is therefore inhibition of Actinin, Alpha 2 (ACTN2, Accession NM_001103), a gene which an actin-binding protein with multiple roles in different cell types. Accordingly, utilities of VGAM2303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTN2. The function of ACTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM88.Centaurin,

Delta 1 (CENTD1, Accession NM_015230) is another VGAM2303 host target gene. CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENTD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2, designated SEQ ID:17561 and SEQ ID:29199 respectively, to the nucleotide sequence of VGAM2303 RNA, herein designated VGAM RNA, also designated SEQ ID:5014.

[78417] Another function of VGAM2303 is therefore inhibition of Centaurin, Delta 1 (CENTD1, Accession NM_015230), a gene which is nvolved in cell signaling/communication. Accordingly, utilities of VGAM2303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD1. The function of CENTD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM445.Synapsin III (SYN3, Accession NM_133633) is another VGAM2303 host target gene. SYN3 BINDING SITE1 through SYN3

BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SYN3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYN3 BINDING SITE1 through SYN3 BINDING SITE3, designated SEQ ID:28594, SEQ ID:9583 and SEQ ID:19543 respectively, to the nucleotide sequence of VGAM2303 RNA, herein designated VGAM RNA, also designated SEQ ID:5014.

[78418] Another function of VGAM2303 is therefore inhibition of Synapsin III (SYN3, Accession NM_133633), a gene which may be involved in the regulation of neurotransmitter release and synaptogenesis. Accordingly, utilities of VGAM2303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYN3. The function of SYN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM925.LOC219688 (Accession XM_167568) is another VGAM2303 host target gene. LOC219688 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219688, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219688 BINDING SITE, designated SEQ ID:44697, to the nucleotide sequence of VGAM2303 RNA, herein designated VGAM RNA, also designated SEQ ID:5014.

[78419] Another function of VGAM2303 is therefore inhibition of LOC219688 (Accession XM_167568). Accordingly, utilities of VGAM2303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219688. LOC255533 (Accession XM_173073) is another VGAM2303 host target gene. LOC255533 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255533 BINDING SITE, designated SEQ ID:46331, to the nucleotide sequence of VGAM2303 RNA, herein designated VGAM RNA, also designated SEQ ID:5014.

[78420] Another function of VGAM2303 is therefore inhibition of LOC255533 (Accession XM_173073). Accordingly, utilities of VGAM2303 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC255533. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2304 (VGAM2304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78421] VGAM2304 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2304 was detected is described hereinabove with reference to Figs. 1-8.

[78422] VGAM2304 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78423] VGAM2304 gene encodes a VGAM2304 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2304 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2304 precursor RNA is desig-

nated SEQ ID:2290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2290 is located at position 35690 relative to the genome of Ectromelia Virus.

[78424] VGAM2304 precursor RNA folds onto itself, forming VGAM2304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78425] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2304 folded precursor RNA into VGAM2304 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2304 RNA is designated SEQ ID:5015, and is provided hereinbelow with reference to the sequence

listing part.

[78426] VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2304 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78427] VGAM2304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2304 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2304 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78428] The complementary binding of VGAM2304 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2304 host target RNA into VGAM2304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78429] It is appreciated that VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2304 host target genes. The mRNA of each one of this plurality of VGAM2304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2304 RNA, herein designated VGAM

RNA, and which when bound by VGAM2304 RNA causes inhibition of translation of respective one or more VGAM2304 host target proteins.

[78430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2304 gene, herein designated VGAM GENE, on one or more VGAM2304 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78431] It is yet further appreciated that a function of VGAM2304 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2304 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2304 correlate with, and may be deduced from, the identity of the host target genes which VGAM2304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78432] Nucleotide sequences of the VGAM2304 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2304 are further described hereinbelow with reference to Table 1.

[78433] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2304 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2304 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78434] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2304 gene, herein designated VGAM is

inhibition of expression of VGAM2304 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2304 correlate with, and may be deduced from, the identity of the target genes which VGAM2304 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78435] CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838) is a VGAM2304 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36188, to the nucleotide sequence of VGAM2304 RNA, herein designated VGAM RNA, also designated SEQ ID:5015.

[78436] A function of VGAM2304 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838). Accordingly, utilities of VGAM2304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. DRIL2 (Accession NM_006465) is another VGAM2304 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13182, to the nucleotide sequence of VGAM2304 RNA, herein designated VGAM RNA, also designated SEQ ID:5015.

[78437] Another function of VGAM2304 is therefore inhibition of DRIL2 (Accession NM_006465). Accordingly, utilities of VGAM2304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. LOC158187 (Accession XM_098892) is another VGAM2304 host target gene. LOC158187 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158187 BINDING SITE, designated SEQ ID:41919, to the nucleotide sequence of VGAM2304 RNA, herein designated VGAM RNA, also designated SEQ ID:5015.

[78438] Another function of VGAM2304 is therefore inhibition of LOC158187 (Accession XM_098892). Accordingly, utilities

of VGAM2304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158187. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2305 (VGAM2305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78439] VGAM2305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2305 was detected is described hereinabove with reference to Figs. 1-8.

[78440] VGAM2305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78441] VGAM2305 gene encodes a VGAM2305 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2305 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2305 precursor RNA is designated SEQ ID:2291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2291 is located at position 38932 relative to the genome of Camelpox Virus.

[78442] VGAM2305 precursor RNA folds onto itself, forming VGAM2305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78443] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2305 folded precursor RNA into VGAM2305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2305 RNA is designated SEQ ID:5016, and

is provided hereinbelow with reference to the sequence listing part.

[78444] VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2305 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78445] VGAM2305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2305 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2305 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78446] The complementary binding of VGAM2305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2305 host target RNA into VGAM2305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78447] It is appreciated that VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2305 host target genes. The mRNA of each one of this plurality of VGAM2305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2305 RNA, herein designated VGAM RNA, and which when bound by VGAM2305 RNA causes inhibition of translation of respective one or more VGAM2305 host target proteins.

[78448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2305 gene, herein designated VGAM GENE, on one or more VGAM2305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78449] It is yet further appreciated that a function of VGAM2305 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2305 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2305 correlate with, and may be deduced from, the identity of the host target genes which VGAM2305 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78450] Nucleotide sequences of the VGAM2305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2305 are further described hereinbelow with reference to Table 1.

[78451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2305 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2305 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78452] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2305 gene, herein designated VGAM is inhibition of expression of VGAM2305 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2305 correlate with, and may be deduced from, the identity of the target genes which VGAM2305 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78453] GA (Accession NM_013267) is a VGAM2305 host target gene. GA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GA BINDING SITE, designated SEQ ID:14936, to the nucleotide sequence of VGAM2305 RNA, herein designated VGAM RNA, also designated SEQ ID:5016.

[78454] A function of VGAM2305 is therefore inhibition of GA (Accession NM_013267). Accordingly, utilities of VGAM2305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GA. KIAA0753 (Accession NM_014804) is another VGAM2305 host target gene. KIAA0753 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by KIAA0753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0753 BINDING SITE, designated SEQ ID:16737, to the nucleotide sequence of VGAM2305 RNA, herein designated VGAM RNA, also designated SEQ ID:5016.

[78455] Another function of VGAM2305 is therefore inhibition of KIAA0753 (Accession NM_014804). Accordingly, utilities of VGAM2305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0753. KIAA1130 (Accession XM_031104) is another VGAM2305 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31289, to the nucleotide sequence of VGAM2305 RNA, herein designated VGAM RNA, also designated SEQ ID:5016.

[78456] Another function of VGAM2305 is therefore inhibition of KIAA1130 (Accession XM_031104). Accordingly, utilities

of VGAM2305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. Ribosomal Protein L36 (RPL36, Accession NM_015414) is another VGAM2305 host target gene. RPL36 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RPL36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL36 BINDING SITE, designated SEQ ID:17715, to the nucleotide sequence of VGAM2305 RNA, herein designated VGAM RNA, also designated SEQ ID:5016.

[78457] Another function of VGAM2305 is therefore inhibition of Ribosomal Protein L36 (RPL36, Accession NM_015414). Accordingly, utilities of VGAM2305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL36. LOC56920 (Accession NM_020163) is another VGAM2305 host target gene. LOC56920 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of LOC56920 BINDING SITE, designated SEQ ID:21381, to the nucleotide sequence of VGAM2305 RNA, herein designated VGAM RNA, also designated SEQ ID:5016.

[78458] Another function of VGAM2305 is therefore inhibition of LOC56920 (Accession NM_020163). Accordingly, utilities of VGAM2305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56920. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2306 (VGAM2306) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78459] VGAM2306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2306 was detected is described hereinabove with reference to Figs. 1-8.

[78460] VGAM2306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2306 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[78461] VGAM2306 gene encodes a VGAM2306 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2306 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2306 precursor RNA is designated SEQ ID:2292, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2292 is located at position 43278 relative to the genome of Ectromelia Virus.

[78462] VGAM2306 precursor RNA folds onto itself, forming VGAM2306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78463] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2306 folded precursor RNA into VGAM2306

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2306 RNA is designated SEQ ID:5017, and is provided hereinbelow with reference to the sequence listing part.

[78464] VGAM2306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2306 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78465] VGAM2306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2306 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78466] The complementary binding of VGAM2306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2306 host target RNA into VGAM2306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[78467] It is appreciated that VGAM2306 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2306 host target genes. The mRNA of each one of this plurality of VGAM2306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2306 RNA, herein designated VGAM RNA, and which when bound by VGAM2306 RNA causes inhibition of translation of respective one or more VGAM2306 host target proteins.

[78468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2306 gene, herein designated VGAM GENE, on one or more VGAM2306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78469] It is yet further appreciated that a function of VGAM2306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2306 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2306 correlate with, and may be deduced from, the identity of the host target genes which VGAM2306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78470] Nucleotide sequences of the VGAM2306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2306 are further described hereinbelow with reference to Table 1.

[78471] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2306 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78472] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2306 gene, herein designated VGAM is inhibition of expression of VGAM2306 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2306 correlate with, and may be deduced from, the identity of the target genes which VGAM2306 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78473] BUB3 Budding Uninhibited By Benzimidazoles 3 Homolog (yeast) (BUB3, Accession NM_004725) is a VGAM2306 host target gene. BUB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BUB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BUB3 BINDING SITE, designated SEQ ID:11094, to the nucleotide sequence of VGAM2306 RNA,

herein designated VGAM RNA, also designated SEQ ID:5017.

[78474] A function of VGAM2306 is therefore inhibition of BUB3 Budding Uninhibited By Benzimidazoles 3 Homolog (yeast) (BUB3, Accession NM_004725), a gene which has a role in the mitotic spindle checkpoint. Accordingly, utilities of VGAM2306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BUB3. The function of BUB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1361.Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007289) is another VGAM2306 host target gene. MME BINDING SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, designated SEQ ID:14159, SEQ ID:6602, SEQ ID:14150 and SEQ ID:14154 respectively, to the nucleotide sequence of VGAM2306

RNA, herein designated VGAM RNA, also designated SEQ ID:5017.

[78475] Another function of VGAM2306 is therefore inhibition of Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007289), a gene which is thermolysin-like specificity. Accordingly, utilities of VGAM2306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MME. The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1332.LOC126669 (Accession XM_060121) is another VGAM2306 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37154, to the nucleotide sequence of VGAM2306 RNA, herein designated VGAM RNA, also designated SEQ ID:5017.

[78476] Another function of VGAM2306 is therefore inhibition of

LOC126669 (Accession XM_060121). Accordingly, utilities of VGAM2306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC154789 (Accession XM_088043) is another VGAM2306 host target gene. LOC154789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154789 BINDING SITE, designated SEQ ID:39485, to the nucleotide sequence of VGAM2306 RNA, herein designated VGAM RNA, also designated SEQ ID:5017.

[78477] Another function of VGAM2306 is therefore inhibition of LOC154789 (Accession XM_088043). Accordingly, utilities of VGAM2306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154789. LOC220963 (Accession XM_166145) is another VGAM2306 host target gene. LOC220963 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:43958, to the nucleotide sequence of VGAM2306 RNA, herein designated VGAM RNA, also designated SEQ ID:5017.

[78478] Another function of VGAM2306 is therefore inhibition of LOC220963 (Accession XM_166145). Accordingly, utilities of VGAM2306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2307 (VGAM2307) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78479] VGAM2307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2307 was detected is described hereinabove with reference to Figs. 1-8.

[78480] VGAM2307 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78481] VGAM2307 gene encodes a VGAM2307 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2307 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2307 precursor RNA is designated SEQ ID:2293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2293 is located at position 122989 relative to the genome of Lumpy Skin Disease Virus.

[78482] VGAM2307 precursor RNA folds onto itself, forming VGAM2307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78483] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2307 folded precursor RNA into VGAM2307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2307 RNA is designated SEQ ID:5018, and is provided hereinbelow with reference to the sequence listing part.

[78484] VGAM2307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2307 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[78485] VGAM2307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2307 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78486] The complementary binding of VGAM2307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2307 host target RNA into VGAM2307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78487] It is appreciated that VGAM2307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2307 host target genes. The mRNA of each one of this plurality of VGAM2307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2307 RNA, herein designated VGAM RNA, and which when bound by VGAM2307 RNA causes inhibition of translation of respective one or more VGAM2307 host target proteins.

[78488] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2307 gene, herein designated VGAM GENE, on one or more VGAM2307 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78489] It is yet further appreciated that a function of VGAM2307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM2307 correlate with, and may be deduced from, the identity of the host target genes which VGAM2307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78490] Nucleotide sequences of the VGAM2307 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2307 are further described hereinbelow with reference to Table 1.

[78491] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2307 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78492] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2307 gene, herein designated VGAM is inhibition of expression of VGAM2307 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2307 correlate with, and may be deduced from, the identity of the target genes which VGAM2307 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78493] Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM_004932) is a VGAM2307 host target gene.

CDH6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11375, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78494] A function of VGAM2307 is therefore inhibition of Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM_004932), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.Carboxypeptidase D (CPD, Accession NM_001304) is another VGAM2307 host target gene. CPD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of CPD BINDING SITE, designated SEQ ID:6981, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78495] Another function of VGAM2307 is therefore inhibition of Carboxypeptidase D (CPD, Accession NM_001304), a gene which is a membrane-bound metalloprotease. Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPD. The function of CPD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM596.Norrie Disease (pseudoglioma) (NDP, Accession NM_000266) is another VGAM2307 host target gene. NDP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP BINDING SITE, designated SEQ ID:5808, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78496] Another function of VGAM2307 is therefore inhibition of Norrie Disease (pseudoglioma) (NDP, Accession NM_000266), a gene which may be involved in a pathway that regulates neural cell differentiation and proliferation. Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP. The function of NDP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113.Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011) is another VGAM2307 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15230, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78497] Another function of VGAM2307 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011). Accordingly, utilities of VGAM2307 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. HSA250839 (Accession NM_018401) is another VGAM2307 host target gene. HSA250839 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSA250839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA250839 BINDING SITE, designated SEQ ID:20436, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78498] Another function of VGAM2307 is therefore inhibition of HSA250839 (Accession NM_018401). Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA250839. LOC149372 (Accession XM_086509) is another VGAM2307 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC149372 BINDING SITE, designated SEQ ID:38732, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78499] Another function of VGAM2307 is therefore inhibition of LOC149372 (Accession XM_086509). Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC149844 (Accession XM_086675) is another VGAM2307 host target gene. LOC149844 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149844 BINDING SITE, designated SEQ ID:38820, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78500] Another function of VGAM2307 is therefore inhibition of LOC149844 (Accession XM_086675). Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149844. LOC51133 (Accession NM_016121) is another VGAM2307 host target gene. LOC51133 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51133 BINDING SITE, designated SEQ ID:18205, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78501] Another function of VGAM2307 is therefore inhibition of LOC51133 (Accession NM_016121). Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51133. LOC89135 (Accession XM_016232) is another VGAM2307 host target gene. LOC89135 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC89135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89135 BINDING SITE, designated SEQ ID:30249, to the nucleotide sequence of VGAM2307 RNA, herein designated VGAM RNA, also designated SEQ ID:5018.

[78502] Another function of VGAM2307 is therefore inhibition of

LOC89135 (Accession XM_016232). Accordingly, utilities of VGAM2307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89135. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2308 (VGAM2308) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78503] VGAM2308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2308 was detected is described hereinabove with reference to Figs. 1-8.

[78504] VGAM2308 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78505] VGAM2308 gene encodes a VGAM2308 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2308 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2308 precursor RNA is designated SEQ ID:2294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2294 is located at position 123501 relative to the genome of Goatpox Virus.

[78506] VGAM2308 precursor RNA folds onto itself, forming VGAM2308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78507] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2308 folded precursor RNA into VGAM2308 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM2308 RNA is designated SEQ ID:5019, and is provided hereinbelow with reference to the sequence listing part.

[78508] VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2308 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78509] VGAM2308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2308 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2308 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78510] The complementary binding of VGAM2308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2308 host target RNA into VGAM2308 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78511] It is appreciated that VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2308 host target genes. The mRNA of each one of this plurality of VGAM2308 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2308 RNA, herein designated VGAM RNA, and which when bound by VGAM2308 RNA causes inhibition of translation of respective one or more VGAM2308 host target proteins.

[78512] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2308 gene, herein designated VGAM GENE, on one or more VGAM2308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78513] It is yet further appreciated that a function of VGAM2308

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2308 correlate with, and may be deduced from, the identity of the host target genes which VGAM2308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78514] Nucleotide sequences of the VGAM2308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2308 are further described hereinbelow with reference to Table 1.

[78515] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2308 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78516] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2308 gene, herein designated VGAM is inhibition of expression of VGAM2308 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2308 correlate with, and may be deduced from, the identity of the target genes which VGAM2308 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78517] Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041) is a VGAM2308 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:22561, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78518] A function of VGAM2308 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GAN. The function of GAN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM606.DKFZP434F0318 (Accession NM_030817) is another VGAM2308 host target gene. DKFZP434F0318 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:25139, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78519] Another function of VGAM2308 is therefore inhibition of DKFZP434F0318 (Accession NM_030817). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318. DKFZP761E2110 (Accession NM_030953) is another VGAM2308 host target gene. DKFZP761E2110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

DKFZP761E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761E2110 BINDING SITE, designated SEQ ID:25223, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78520] Another function of VGAM2308 is therefore inhibition of DKFZP761E2110 (Accession NM_030953). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761E2110. KIAA1393 (Accession XM_050793) is another VGAM2308 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35686, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78521] Another function of VGAM2308 is therefore inhibition of KIAA1393 (Accession XM_050793). Accordingly, utilities

of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. KIAA1495 (Accession XM_055080) is another VGAM2308 host target gene. KIAA1495 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1495 BINDING SITE, designated SEQ ID:36224, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78522] Another function of VGAM2308 is therefore inhibition of KIAA1495 (Accession XM_055080). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1495. KIAA1954 (Accession XM_085375) is another VGAM2308 host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1954 BINDING SITE, designated SEQ ID:38096, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78523] Another function of VGAM2308 is therefore inhibition of KIAA1954 (Accession XM_085375). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1954. Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316) is another VGAM2308 host target gene. KPNA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KPNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:14686, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78524] Another function of VGAM2308 is therefore inhibition of Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6. RAP140 (Accession

NM_015224) is another VGAM2308 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:17555, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78525] Another function of VGAM2308 is therefore inhibition of RAP140 (Accession NM_015224). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863) is another VGAM2308 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11275, to the nucleotide se-

quence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78526] Another function of VGAM2308 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. LOC115219 (Accession XM_055499) is another VGAM2308 host target gene. LOC115219 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115219 BINDING SITE, designated SEQ ID:36277, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78527] Another function of VGAM2308 is therefore inhibition of LOC115219 (Accession XM_055499). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115219. LOC202451 (Accession XM_117401) is another VGAM2308 host target gene. LOC202451 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202451 BINDING SITE, designated SEQ ID:43438, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78528] Another function of VGAM2308 is therefore inhibition of LOC202451 (Accession XM_117401). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202451. LOC51185 (Accession NM_016302) is another VGAM2308 host target gene. LOC51185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51185 BINDING SITE, designated SEQ ID:18423, to the nucleotide sequence of VGAM2308 RNA, herein designated VGAM RNA, also designated SEQ ID:5019.

[78529] Another function of VGAM2308 is therefore inhibition of

LOC51185 (Accession NM_016302). Accordingly, utilities of VGAM2308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51185. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2309 (VGAM2309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78530] VGAM2309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2309 was detected is described hereinabove with reference to Figs. 1-8.

[78531] VGAM2309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78532] VGAM2309 gene encodes a VGAM2309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2309 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2309 precursor RNA is designated SEQ ID:2295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2295 is located at position 127569 relative to the genome of Lumpy Skin Disease Virus.

[78533] VGAM2309 precursor RNA folds onto itself, forming VGAM2309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78534] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2309 folded precursor RNA into VGAM2309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2309 RNA is designated SEQ ID:5020, and is provided hereinbelow with reference to the sequence listing part.

[78535] VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2309 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78536] VGAM2309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2309 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2309 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78537] The complementary binding of VGAM2309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2309 host target RNA into VGAM2309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78538] It is appreciated that VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2309 host target genes. The mRNA of each one of this plurality of VGAM2309 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2309 RNA, herein designated VGAM RNA, and which when bound by VGAM2309 RNA causes inhibition of translation of respective one or more VGAM2309 host target proteins.

[78539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2309 gene, herein designated VGAM GENE, on one or more VGAM2309 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78540] It is yet further appreciated that a function of VGAM2309

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2309 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM2309 correlate with, and may be deduced from, the identity of the host target genes which VGAM2309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78541] Nucleotide sequences of the VGAM2309 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2309 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2309 are further described hereinbelow with reference to Table 1.

[78542] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2309 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2309 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78543] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2309 gene, herein designated VGAM is inhibition of expression of VGAM2309 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2309 correlate with, and may be deduced from, the identity of the target genes which VGAM2309 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78544] FLJ23189 (Accession NM_025057) is a VGAM2309 host target gene. FLJ23189 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23189 BINDING SITE, designated SEQ ID:24656, to the nucleotide sequence of VGAM2309 RNA, herein designated VGAM RNA, also designated SEQ ID:5020.

[78545] A function of VGAM2309 is therefore inhibition of FLJ23189 (Accession NM_025057). Accordingly, utilities of VGAM2309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23189. Fig. 1 further provides a conceptual description

of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2310 (VGAM2310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78546] VGAM2310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2310 was detected is described hereinabove with reference to Figs. 1-8.

[78547] VGAM2310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78548] VGAM2310 gene encodes a VGAM2310 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2310 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2310 precursor RNA is designated SEQ ID:2296, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2296 is located at position 135569 relative to the genome of Lumpy Skin Disease Virus.

[78549] VGAM2310 precursor RNA folds onto itself, forming VGAM2310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78550] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2310 folded precursor RNA into VGAM2310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2310 RNA is designated SEQ ID:5021, and is provided hereinbelow with reference to the sequence listing part.

[78551] VGAM2310 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2310 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78552] VGAM2310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2310 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2310 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78553] The complementary binding of VGAM2310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2310 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2310 host target RNA into VGAM2310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78554] It is appreciated that VGAM2310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2310 host target genes. The mRNA of each one of this plurality of VGAM2310 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2310 RNA, herein designated VGAM RNA, and which when bound by VGAM2310 RNA causes inhibition of translation of respective one or more

VGAM2310 host target proteins.

[78555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2310 gene, herein designated VGAM GENE, on one or more VGAM2310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78556] It is yet further appreciated that a function of VGAM2310 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus.

Specific functions, and accordingly utilities, of VGAM2310 correlate with, and may be deduced from, the identity of the host target genes which VGAM2310 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78557] Nucleotide sequences of the VGAM2310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2310 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2310 are further described hereinbelow with reference to Table 1.

[78558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2310 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2310 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78559] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2310 gene, herein designated VGAM is inhibition of expression of VGAM2310 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2310 correlate with, and may be deduced from, the identity of the target genes which VGAM2310 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78560] Caldesmon 1 (CALD1, Accession NM_033138) is a VGAM2310 host target gene. CALD1 BINDING SITE1 and CALD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CALD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALD1 BINDING SITE1 and CALD1 BINDING SITE2, designated SEQ ID:26991 and SEQ ID:27009 respectively, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78561] A function of VGAM2310 is therefore inhibition of Caldesmon 1 (CALD1, Accession NM_033138), a gene which is implicated in the regulation of actomyosin interactions in smooth muscle and nonmuscle cells. Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALD1. The function of CALD1 and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1960.Secreted Frizzled-related Protein 4 (SFRP4, Accession NM_003014) is another VGAM2310 host target gene. SFRP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP4 BINDING SITE, designated SEQ ID:8937, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78562] Another function of VGAM2310 is therefore inhibition of Secreted Frizzled-related Protein 4 (SFRP4, Accession NM_003014). Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP4. CG018 (Accession NM_052818) is another VGAM2310 host target gene. CG018 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CG018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CG018 BINDING SITE, designated SEQ ID:27404, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78563] Another function of VGAM2310 is therefore inhibition of CG018 (Accession NM_052818). Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG018. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM2310 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32524, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78564] Another function of VGAM2310 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with HIC2. HTGN29 (Accession NM_020199) is another VGAM2310 host target gene. HTGN29 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTGN29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTGN29 BINDING SITE, designated SEQ ID:21431, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78565] Another function of VGAM2310 is therefore inhibition of HTGN29 (Accession NM_020199). Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTGN29. KIAA1257 (Accession XM_031577) is another VGAM2310 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31438, to the

nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78566] Another function of VGAM2310 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. LOC201725 (Accession XM_114370) is another VGAM2310 host target gene. LOC201725 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201725 BINDING SITE, designated SEQ ID:42904, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78567] Another function of VGAM2310 is therefore inhibition of LOC201725 (Accession XM_114370). Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201725. LOC221810 (Accession XM_168222) is another VGAM2310 host target gene. LOC221810 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC221810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221810 BINDING SITE, designated SEQ ID:45082, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78568] Another function of VGAM2310 is therefore inhibition of LOC221810 (Accession XM_168222). Accordingly, utilities of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221810. LOC256073 (Accession XM_172972) is another VGAM2310 host target gene. LOC256073 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256073 BINDING SITE, designated SEQ ID:46228, to the nucleotide sequence of VGAM2310 RNA, herein designated VGAM RNA, also designated SEQ ID:5021.

[78569] Another function of VGAM2310 is therefore inhibition of LOC256073 (Accession XM_172972). Accordingly, utilities

of VGAM2310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256073. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2311 (VGAM2311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78570] VGAM2311 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2311 was detected is described hereinabove with reference to Figs. 1-8.

[78571] VGAM2311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78572] VGAM2311 gene encodes a VGAM2311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2311 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2311 precursor RNA is designated SEQ ID:2297, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2297 is located at position 139025 relative to the genome of Lumpy Skin Disease Virus.

[78573] VGAM2311 precursor RNA folds onto itself, forming VGAM2311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78574] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2311 folded precursor RNA into VGAM2311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2311 RNA is designated SEQ ID:5022, and

is provided hereinbelow with reference to the sequence listing part.

[78575] VGAM2311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2311 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78576] VGAM2311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2311 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78577] The complementary binding of VGAM2311 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2311 host target RNA into VGAM2311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78578] It is appreciated that VGAM2311 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2311 host target genes. The mRNA of each one of this plurality of VGAM2311 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2311 RNA, herein designated VGAM RNA, and which when bound by VGAM2311 RNA causes inhibition of translation of respective one or more VGAM2311 host target proteins.

[78579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2311 gene, herein designated VGAM GENE, on one or more VGAM2311 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78580] It is yet further appreciated that a function of VGAM2311 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM2311 correlate with, and may be deduced from, the identity of the host target genes which VGAM2311 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78581] Nucleotide sequences of the VGAM2311 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2311 are further described hereinbelow with reference to Table 1.

[78582] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2311 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2311 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78583] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2311 gene, herein designated VGAM is inhibition of expression of VGAM2311 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2311 correlate with, and may be deduced from, the identity of the target genes which VGAM2311 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78584] Myotubularin Related Protein 8 (MTMR8, Accession NM_015458) is a VGAM2311 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17746, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78585] A function of VGAM2311 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of

MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379.PR Domain Containing 4 (PRDM4, Accession NM_012406) is another VGAM2311 host target gene. PRDM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM4 BINDING SITE, designated SEQ ID:14786, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78586] Another function of VGAM2311 is therefore inhibition of PR Domain Containing 4 (PRDM4, Accession NM_012406). Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM4. Solute Carrier Family 35 (UDP-N-acetylglucosamine (UDP-GlcNAc) Transporter), Member 3 (SLC35A3, Accession NM_012243) is another VGAM2311 host target gene. SLC35A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC35A3, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC35A3 BINDING SITE, designated SEQ ID:14548, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78587] Another function of VGAM2311 is therefore inhibition of Solute Carrier Family 35 (UDP-N-acetylglucosamine (UDP-GlcNAc) Transporter), Member 3 (SLC35A3, Accession NM_012243). Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC35A3. SON DNA Binding Protein (SON, Accession NM_058183) is another VGAM2311 host target gene. SON BINDING SITE1 through SON BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SON, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SON BINDING SITE1 through SON BINDING SITE3, designated SEQ ID:27744, SEQ ID:29040 and SEQ ID:29045 respectively, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ

ID:5022.

[78588] Another function of VGAM2311 is therefore inhibition of SON DNA Binding Protein (SON, Accession NM_058183). Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SON. KIAA1600 (Accession XM_049351) is another VGAM2311 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35390, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78589] Another function of VGAM2311 is therefore inhibition of KIAA1600 (Accession XM_049351). Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. MGC4737 (Accession NM_031466) is another VGAM2311 host target gene. MGC4737 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by MGC4737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4737 BINDING SITE, designated SEQ ID:25507, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78590] Another function of VGAM2311 is therefore inhibition of MGC4737 (Accession NM_031466). Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4737. LOC126964 (Accession XM_059100) is another VGAM2311 host target gene. LOC126964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126964 BINDING SITE, designated SEQ ID:36884, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78591] Another function of VGAM2311 is therefore inhibition of LOC126964 (Accession XM_059100). Accordingly, utilities

of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126964. LOC128344 (Accession XM_059234) is another VGAM2311 host target gene. LOC128344 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128344 BINDING SITE, designated SEQ ID:36923, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78592] Another function of VGAM2311 is therefore inhibition of LOC128344 (Accession XM_059234). Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128344. LOC152245 (Accession XM_098182) is another VGAM2311 host target gene. LOC152245 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152245 BINDING SITE, designated SEQ ID:41451, to the nucleotide sequence of VGAM2311 RNA, herein designated VGAM RNA, also designated SEQ ID:5022.

[78593] Another function of VGAM2311 is therefore inhibition of LOC152245 (Accession XM_098182). Accordingly, utilities of VGAM2311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152245. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2312 (VGAM2312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78594] VGAM2312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2312 was detected is described hereinabove with reference to Figs. 1-8.

[78595] VGAM2312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78596] VGAM2312 gene encodes a VGAM2312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2312 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2312 precursor RNA is designated SEQ ID:2298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2298 is located at position 2051 relative to the genome of Lumpy Skin Disease Virus.

[78597] VGAM2312 precursor RNA folds onto itself, forming VGAM2312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78598] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2312 folded precursor RNA into VGAM2312 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2312 RNA is designated SEQ ID:5023, and is provided hereinbelow with reference to the sequence listing part.

[78599] VGAM2312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2312 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78600] VGAM2312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2312 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78601] The complementary binding of VGAM2312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2312 host target RNA into VGAM2312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78602] It is appreciated that VGAM2312 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2312 host target genes. The mRNA of each one of this plurality of VGAM2312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2312 RNA, herein designated VGAM RNA, and which when bound by VGAM2312 RNA causes inhibition of translation of respective one or more VGAM2312 host target proteins.

[78603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2312 gene, herein designated VGAM GENE, on one or more VGAM2312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78604] It is yet further appreciated that a function of VGAM2312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM2312 correlate with, and may be deduced from, the identity of the host target genes which VGAM2312 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78605] Nucleotide sequences of the VGAM2312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2312 are further described hereinbelow with reference to Table 1.

[78606] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2312 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2312 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78607] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2312 gene, herein designated VGAM is inhibition of expression of VGAM2312 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2312 correlate with, and may be deduced from, the identity of the target genes which VGAM2312 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78608] Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463) is a VGAM2312 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11956, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78609] A function of VGAM2312 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870) is another VGAM2312 host target gene. HTR4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE, designated SEQ ID:6544, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78610] Another function of VGAM2312 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870), a gene which mediates calcium

channel currents. Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR4. The function of HTR4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65.V-src Sarcoma (Schmidt-Ruppin A-2) Viral Oncogene Homolog (avian) (SRC, Accession NM_005417) is another VGAM2312 host target gene. SRC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRC BINDING SITE, designated SEQ ID:11887, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78611] Another function of VGAM2312 is therefore inhibition of V-src Sarcoma (Schmidt-Ruppin A-2) Viral Oncogene Homolog (avian) (SRC, Accession NM_005417), a gene which is a tyrosine kinase. Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRC. The function

of SRC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM721.Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056) is another VGAM2312 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:6720, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78612] Another function of VGAM2312 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C1. Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481) is another VGAM2312 host target gene. TCF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by TCF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE, designated SEQ ID:13202, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78613] Another function of VGAM2312 is therefore inhibition of Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481), a gene which probably binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF2. The function of TCF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118.Testis Enhanced Gene Transcript (BAX inhibitor 1) (TEGT, Accession XM_035490) is another VGAM2312 host target gene. TEGT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEGT BINDING SITE, designated SEQ ID:32274, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78614] Another function of VGAM2312 is therefore inhibition of Testis Enhanced Gene Transcript (BAX inhibitor 1) (TEGT, Accession XM_035490), a gene which is a suppressor of apoptosis. Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEGT. The function of TEGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2276.Visinin-like 1 (VSNL1, Accession NM_003385) is another VGAM2312 host target gene. VSNL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VSNL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VSNL1 BINDING SITE, designated SEQ ID:9418, to the nucleotide sequence of VGAM2312 RNA, herein designated

VGAM RNA, also designated SEQ ID:5023.

[78615] Another function of VGAM2312 is therefore inhibition of Visinin-like 1 (VSNL1, Accession NM_003385). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VSNL1. DCOHM (Accession NM_032151) is another VGAM2312 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25844, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78616] Another function of VGAM2312 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. EFS2 (Accession NM_005864) is another VGAM2312 host target gene. EFS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFS2, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFS2 BINDING SITE, designated SEQ ID:12480, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78617] Another function of VGAM2312 is therefore inhibition of EFS2 (Accession NM_005864). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFS2. FLJ10511 (Accession NM_018120) is another VGAM2312 host target gene. FLJ10511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10511 BINDING SITE, designated SEQ ID:19901, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78618] Another function of VGAM2312 is therefore inhibition of FLJ10511 (Accession NM_018120). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10511. FLJ20040 (Accession NM_018992) is another VGAM2312 host target gene. FLJ20040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20040 BINDING SITE, designated SEQ ID:21067, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78619] Another function of VGAM2312 is therefore inhibition of FLJ20040 (Accession NM_018992). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20040. FLJ22569 (Accession NM_023925) is another VGAM2312 host target gene. FLJ22569 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22569, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22569 BINDING SITE, designated SEQ ID:23401, to the nucleotide

sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78620] Another function of VGAM2312 is therefore inhibition of FLJ22569 (Accession NM_023925). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22569. FLJ23053 (Accession NM_022907) is another VGAM2312 host target gene. FLJ23053 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23053 BINDING SITE, designated SEQ ID:23208, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78621] Another function of VGAM2312 is therefore inhibition of FLJ23053 (Accession NM_022907). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23053. Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613) is another VGAM2312 host target gene. GRID1 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by GRID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:33978, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78622] Another function of VGAM2312 is therefore inhibition of Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1. KIAA0268 (Accession XM_046126) is another VGAM2312 host target gene. KIAA0268 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0268 BINDING SITE, designated SEQ ID:34684, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78623] Another function of VGAM2312 is therefore inhibition of KIAA0268 (Accession XM_046126). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0268. MGC12466 (Accession XM_086336) is another VGAM2312 host target gene. MGC12466 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC12466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12466 BINDING SITE, designated SEQ ID:38610, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78624] Another function of VGAM2312 is therefore inhibition of MGC12466 (Accession XM_086336). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12466. LOC145135 (Accession XM_096721) is another VGAM2312 host target gene. LOC145135 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145135, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145135 BINDING SITE, designated SEQ ID:40498, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78625] Another function of VGAM2312 is therefore inhibition of LOC145135 (Accession XM_096721). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145135. LOC196528 (Accession XM_113745) is another VGAM2312 host target gene. LOC196528 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196528 BINDING SITE, designated SEQ ID:42407, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78626] Another function of VGAM2312 is therefore inhibition of LOC196528 (Accession XM_113745). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196528. LOC92303 (Accession XM_044108) is another VGAM2312 host target gene. LOC92303 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92303 BINDING SITE, designated SEQ ID:34135, to the nucleotide sequence of VGAM2312 RNA, herein designated VGAM RNA, also designated SEQ ID:5023.

[78627] Another function of VGAM2312 is therefore inhibition of LOC92303 (Accession XM_044108). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92303. LOC93587 (Accession XM_052377) is another VGAM2312 host target gene. LOC93587 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93587 BINDING SITE, designated SEQ ID:35964, to the nucleotide sequence of VGAM2312 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5023.

[78628] Another function of VGAM2312 is therefore inhibition of LOC93587 (Accession XM_052377). Accordingly, utilities of VGAM2312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93587. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2313 (VGAM2313) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78629] VGAM2313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2313 was detected is described hereinabove with reference to Figs. 1-8.

[78630] VGAM2313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78631] VGAM2313 gene encodes a VGAM2313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2313 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2313 precursor RNA is designated SEQ ID:2299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2299 is located at position 146111 relative to the genome of Lumpy Skin Disease Virus.

[78632] VGAM2313 precursor RNA folds onto itself, forming VGAM2313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78633] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2313 folded precursor RNA into VGAM2313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM2313 RNA is designated SEQ ID:5024, and is provided hereinbelow with reference to the sequence listing part.

[78634] VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2313 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78635] VGAM2313 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2313 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78636] The complementary binding of VGAM2313 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2313 host target RNA into VGAM2313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78637] It is appreciated that VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2313 host target genes. The mRNA of

each one of this plurality of VGAM2313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2313 RNA, herein designated VGAM RNA, and which when bound by VGAM2313 RNA causes inhibition of translation of respective one or more VGAM2313 host target proteins.

[78638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2313 gene, herein designated VGAM GENE, on one or more VGAM2313 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[78639] It is yet further appreciated that a function of VGAM2313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM2313 correlate with, and may be deduced from, the identity of the host target genes which VGAM2313 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78640] Nucleotide sequences of the VGAM2313 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2313 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2313 are further described hereinbelow with reference to Table 1.

[78641] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2313 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2313 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78642] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2313 gene, herein designated VGAM is inhibition of expression of VGAM2313 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2313 correlate with, and may be deduced from, the identity of the target genes which VGAM2313 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78643] Glucosaminyl (N-acetyl) Transferase 1, Core 2 (beta-1,6-N-acetylglucosaminyltransferase) (GCNT1, Accession NM_001490) is a VGAM2313 host target gene. GCNT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT1 BINDING SITE, designated SEQ ID:7236, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78644] A function of VGAM2313 is therefore inhibition of Glu-

cosaminyl (N-acetyl) Transferase 1, Core 2 (beta-1,6-N-acetylglucosaminyltransferase) (GCNT1, Accession NM_001490), a gene which forms critical branches in o-glycans. Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT1. The function of GCNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM149.Serine/threonine Kinase 6 (STK6, Accession NM_003600) is another VGAM2313 host target gene. STK6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK6 BINDING SITE, designated SEQ ID:9653, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78645] Another function of VGAM2313 is therefore inhibition of Serine/threonine Kinase 6 (STK6, Accession NM_003600), a gene which is serine/threonine kinase 6 which is most highly expressed during mitosis. Accordingly, utilities of

VGAM2313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK6. The function of STK6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1212.FLJ12595 (Accession NM_024994) is another VGAM2313 host target gene. FLJ12595 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12595 BINDING SITE, designated SEQ ID:24555, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78646] Another function of VGAM2313 is therefore inhibition of FLJ12595 (Accession NM_024994). Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12595. HSPC031 (Accession NM_016101) is another VGAM2313 host target gene. HSPC031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPC031, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC031 BINDING SITE, designated SEQ ID:18183, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78647] Another function of VGAM2313 is therefore inhibition of HSPC031 (Accession NM_016101). Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC031. KIAA1719 (Accession XM_042936) is another VGAM2313 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33815, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78648] Another function of VGAM2313 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM2313 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1719. pcnp (Accession NM_020357) is another VGAM2313 host target gene. pcnp BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by pcnp, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of pcnp BINDING SITE, designated SEQ ID:21624, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78649] Another function of VGAM2313 is therefore inhibition of pcnp (Accession NM_020357). Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with pcnp. Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_005704) is another VGAM2313 host target gene. PTPRU BINDING SITE1 through PTPRU BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRU BINDING

SITE1 through PTPRU BINDING SITE3, designated SEQ ID:12253, SEQ ID:28403 and SEQ ID:28398 respectively, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78650] Another function of VGAM2313 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_005704). Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRU. LOC202108 (Accession XM_114442) is another VGAM2313 host target gene. LOC202108 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202108 BINDING SITE, designated SEQ ID:42964, to the nucleotide sequence of VGAM2313 RNA, herein designated VGAM RNA, also designated SEQ ID:5024.

[78651] Another function of VGAM2313 is therefore inhibition of LOC202108 (Accession XM_114442). Accordingly, utilities of VGAM2313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC202108. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2314 (VGAM2314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78652] VGAM2314 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2314 was detected is described hereinabove with reference to Figs. 1-8.

[78653] VGAM2314 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78654] VGAM2314 gene encodes a VGAM2314 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2314 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2314 precursor RNA is designated SEQ ID:2300, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2300 is located at position 715 relative to the genome of Lumpy Skin Disease Virus.

[78655] VGAM2314 precursor RNA folds onto itself, forming VGAM2314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78656] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2314 folded precursor RNA into VGAM2314 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2314 RNA is designated SEQ ID:5025, and is provided hereinbelow with reference to the sequence listing part.

[78657] VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2314 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78658] VGAM2314 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2314 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78659] The complementary binding of VGAM2314 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2314 host target RNA into VGAM2314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78660] It is appreciated that VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2314 host target genes. The mRNA of each one of this plurality of VGAM2314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2314 RNA, herein designated VGAM RNA, and which when bound by VGAM2314 RNA causes

inhibition of translation of respective one or more VGAM2314 host target proteins.

[78661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2314 gene, herein designated VGAM GENE, on one or more VGAM2314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78662] It is yet further appreciated that a function of VGAM2314 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2314 include diagnosis, prevention and

treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM2314 correlate with, and may be deduced from, the identity of the host target genes which VGAM2314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78663] Nucleotide sequences of the VGAM2314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2314 are further described hereinbelow with reference to Table 1.

[78664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2314 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78665] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2314 gene, herein designated VGAM is inhibition of expression of VGAM2314 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2314 correlate with, and may be deduced from, the identity of the target genes which VGAM2314 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78666] ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681) is a VGAM2314 host target gene. ATP2A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A2 BINDING SITE, designated SEQ ID:7399, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78667] A function of VGAM2314 is therefore inhibition of ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A2. Cartilage Associated Protein (CRTAP, Accession NM_006371) is another VGAM2314 host target gene. CR-

TAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:13059, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78668] Another function of VGAM2314 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP. The function of CRTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Casein Kinase 2, Alpha 1 Polypeptide (CSNK2A1, Accession NM_001895) is another VGAM2314 host target gene. CSNK2A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSNK2A1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK2A1 BINDING SITE, designated SEQ ID:7622, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78669] Another function of VGAM2314 is therefore inhibition of Casein Kinase 2, Alpha 1 Polypeptide (CSNK2A1, Accession NM_001895), a gene which cphosphorylates acidic protein such as casein. Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK2A1. The function of CSNK2A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1597.Hippocalcin-like 1 (HPCAL1, Accession NM_002149) is another VGAM2314 host target gene. HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HPCAL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL1 BINDING SITE1

and HPCAL1 BINDING SITE2, designated SEQ ID:7929 and SEQ ID:28636 respectively, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78670] Another function of VGAM2314 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM_002149). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068) is another VGAM2314 host target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11507, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78671] Another function of VGAM2314 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utili-

ties of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM_144585) is another VGAM2314 host target gene. SLC22A12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A12 BINDING SITE, designated SEQ ID:29401, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78672] Another function of VGAM2314 is therefore inhibition of Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM_144585), a gene which is a urate -anion exchanger regulating blood yrate levels. Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SLC22A12. The function of SLC22A12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1034.Transforming Growth Factor, Alpha (TGFA, Accession NM_003236) is another VGAM2314 host target gene. TGFA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGFA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:9229, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78673] Another function of VGAM2314 is therefore inhibition of Transforming Growth Factor, Alpha (TGFA, Accession NM_003236), a gene which is able to bind to the egf receptor and to act synergistically with tgf beta to promote anchorage-independent cell proliferation in soft agar. Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA. The function of TGFA and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM328.Ubiquitin-conjugating Enzyme E2B (RAD6 homolog) (UBE2B, Accession NM_003337) is another VGAM2314 host target gene. UBE2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2B BINDING SITE, designated SEQ ID:9344, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78674] Another function of VGAM2314 is therefore inhibition of Ubiquitin-conjugating Enzyme E2B (RAD6 homolog) (UBE2B, Accession NM_003337), a gene which catalyzes the covalent attachment of ubiquitin to other proteins and is required for postreplication repair of uv-damaged dna. Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2B. The function of UBE2B has been established by previous studies. The RAD6 pathway is central to postreplicative DNA repair in eukaryotic cells.

Two principal elements of this pathway are the ubiquitin-conjugating enzymes RAD6 and the MMS2 (OMIM Ref. No. 603001)-UBC13 (OMIM Ref. No. 603679) heterodimer, which are recruited to chromatin by the RING-finger proteins RAD18 (OMIM Ref. No. 605256) and RAD5 (OMIM Ref. No. 607266), respectively. Hoege et al. (2002) showed that UBC9 (OMIM Ref. No. 601661), a small ubiquitin-related modifier (SUMO)-conjugating enzyme, is also affiliated with this pathway and that proliferating cell nuclear antigen (PCNA; 176740), a DNA polymerase sliding clamp involved in DNA synthesis and repair, is a substrate. PCNA is monoubiquitinated through RAD6 and RAD18, modified by lys63-linked multiubiquitination, which additionally requires MMS2, UBC13, and RAD5, and is conjugated to SUMO by UBC9. All 3 modifications affect the same lysine residue of PCNA, K164, suggesting that they label PCNA for alternative functions. Hoege et al. (2002) demonstrated that these modifications differentially affect resistance to DNA damage, and that damage-induced PCNA ubiquitination is elementary for DNA repair and occurs at the same conserved residue in yeast and humans. Animal model experiments lend further support to the function of UBE2B. Roest et al. (1996) reported the

phenotype of the first animal mutant in the ubiquitin pathway. Experimental inactivation of the RAD6B gene in mice caused male infertility. Derailment of spermatogenesis became overt during the postmeiotic condensation of chromatin in spermatids. In yeast the gene is not only implicated in postreplication repair and damage-induced mutagenesis but is also required for sporulation and may modulate chromatin structure via histone ubiquitination. The authors stated that the findings in the 'knock-out' mice provided a parallel between yeast sporulation and mammalian spermatogenesis and strongly implicated RAD6-dependent ubiquitination in chromatin remodeling in the human. Since heterozygous male mice and even knockout female mice are completely normal and fertile and thus able to transmit the defect, similar RAD6B mutations may cause male infertility in man. The fact that the RAD6B mice are viable and phenotypically normal is presumably due to functional redundancy with RAD6A (OMIM Ref. No. 312180).

[78675] It is appreciated that the abovementioned animal model for UBE2B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[78676] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78677] Hoege, C.; Pfander, B.; Moldovan, G.-L.; Pyrowolakis, G.; Jentsch, S. : RAD6-dependent DNA repair is linked to modification of PCNA by ubiquitin and SUMO. Nature 419: 135-141, 2002. ; and

[78678] Roest, H. P.; van Klaveren, J.; de Wit, J.; van Gurp, C. G.; Koken, M. H. M.; Vermey, M.; van Roijen, J. H.; Hooger-brugge, J. W.; Vreeburg, J. T. M.; Baarends, W. M.; Bootsma, D.; Grootego.

[78679] Further studies establishing the function and utilities of UBE2B are found in John Hopkins OMIM database record ID 179095, and in sited publications numbered 1793-1194 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ10468 (Accession NM_018101) is another VGAM2314 host target gene. FLJ10468 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-cleotide sequences of FLJ10468 BINDING SITE, designated

SEQ ID:19872, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78680] Another function of VGAM2314 is therefore inhibition of FLJ10468 (Accession NM_018101). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10468. FLJ14146 (Accession NM_024709) is another VGAM2314 host target gene. FLJ14146 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:24028, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78681] Another function of VGAM2314 is therefore inhibition of FLJ14146 (Accession NM_024709). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146. FLJ20651 (Accession NM_017919) is another VGAM2314 host target gene. FLJ20651 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20651 BINDING SITE, designated SEQ ID:19573, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78682] Another function of VGAM2314 is therefore inhibition of FLJ20651 (Accession NM_017919). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20651. FLJ21162 (Accession NM_024873) is another VGAM2314 host target gene. FLJ21162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21162 BINDING SITE, designated SEQ ID:24305, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78683] Another function of VGAM2314 is therefore inhibition of

FLJ21162 (Accession NM_024873). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21162. KIAA0164 (Accession NM_014739) is another VGAM2314 host target gene. KIAA0164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0164 BINDING SITE, designated SEQ ID:16402, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78684] Another function of VGAM2314 is therefore inhibition of KIAA0164 (Accession NM_014739). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0164. KIAA0356 (Accession XM_038655) is another VGAM2314 host target gene. KIAA0356 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0356 BINDING SITE, designated SEQ ID:32889, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78685] Another function of VGAM2314 is therefore inhibition of KIAA0356 (Accession XM_038655). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0356. KIAA0514 (Accession NM_014696) is another VGAM2314 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16199, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78686] Another function of VGAM2314 is therefore inhibition of KIAA0514 (Accession NM_014696). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA1610 (Accession XM_040622) is another

VGAM2314 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33341, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78687] Another function of VGAM2314 is therefore inhibition of KIAA1610 (Accession XM_040622). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1610. KIAA1954 (Accession XM_085375) is another VGAM2314 host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:38090, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78688] Another function of VGAM2314 is therefore inhibition of KIAA1954 (Accession XM_085375). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1954. Peroxisomal Biogenesis Factor 12 (PEX12, Accession NM_000286) is another VGAM2314 host target gene. PEX12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PEX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX12 BINDING SITE, designated SEQ ID:5832, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78689] Another function of VGAM2314 is therefore inhibition of Peroxisomal Biogenesis Factor 12 (PEX12, Accession NM_000286). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX12. RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM_171061) is another VGAM2314 host target gene. RAP2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by RAP2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP2B BINDING SITE, designated SEQ ID:45858, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78690] Another function of VGAM2314 is therefore inhibition of RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM_171061). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP2B. LOC151877 (Accession XM_098132) is another VGAM2314 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41392, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78691] Another function of VGAM2314 is therefore inhibition of

LOC151877 (Accession XM_098132). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC168489 (Accession XM_095134) is another VGAM2314 host target gene. LOC168489 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC168489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168489 BINDING SITE, designated SEQ ID:40249, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78692] Another function of VGAM2314 is therefore inhibition of LOC168489 (Accession XM_095134). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168489. LOC197319 (Accession XM_113862) is another VGAM2314 host target gene. LOC197319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC197319 BINDING SITE, designated SEQ ID:42474, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78693] Another function of VGAM2314 is therefore inhibition of LOC197319 (Accession XM_113862). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197319. LOC221773 (Accession XM_165802) is another VGAM2314 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43758, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78694] Another function of VGAM2314 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. LOC90591 (Accession XM_032811) is an-

other VGAM2314 host target gene. LOC90591 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:31757, to the nucleotide sequence of VGAM2314 RNA, herein designated VGAM RNA, also designated SEQ ID:5025.

[78695] Another function of VGAM2314 is therefore inhibition of LOC90591 (Accession XM_032811). Accordingly, utilities of VGAM2314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2315 (VGAM2315) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78696] VGAM2315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2315 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[78697] VGAM2315 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy Skin Disease Virus. VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78698] VGAM2315 gene encodes a VGAM2315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2315 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2315 precursor RNA is designated SEQ ID:2301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2301 is located at position 128712 relative to the genome of Lumpy Skin Disease Virus.

[78699] VGAM2315 precursor RNA folds onto itself, forming VGAM2315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78700] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2315 folded precursor RNA into VGAM2315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2315 RNA is designated SEQ ID:5026, and is provided hereinbelow with reference to the sequence listing part.

[78701] VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2315 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78702] VGAM2315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2315 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2315 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78703] The complementary binding of VGAM2315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2315 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2315 host target RNA into VGAM2315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78704] It is appreciated that VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2315 host target genes. The mRNA of each one of this plurality of VGAM2315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2315 RNA, herein designated VGAM RNA, and which when bound by VGAM2315 RNA causes inhibition of translation of respective one or more VGAM2315 host target proteins.

[78705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2315 gene, herein designated VGAM GENE, on one or more VGAM2315 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78706] It is yet further appreciated that a function of VGAM2315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2315 include diagnosis, prevention and treatment of viral infection by Lumpy Skin Disease Virus. Specific functions, and accordingly utilities, of VGAM2315 correlate with, and may be deduced from, the identity of the host target genes which VGAM2315 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78707] Nucleotide sequences of the VGAM2315 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2315 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2315 are further described hereinbelow with reference to Table 1.

[78708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2315 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2315 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78709] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2315 gene, herein designated VGAM is inhibition of expression of VGAM2315 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2315 correlate with, and may be deduced from, the identity of the target genes which VGAM2315 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78710] Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080) is a VGAM2315 host target gene. TRPM8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPM8, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:23518, to the nucleotide sequence of VGAM2315 RNA, herein designated VGAM RNA, also designated SEQ ID:5026.

[78711] A function of VGAM2315 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM2315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of TRPM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM201.UDP-glucose Dehydrogenase (UGDH, Accession NM_003359) is another VGAM2315 host target gene. UGDH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UGDH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of UGDH BINDING SITE, designated SEQ ID:9386, to the nucleotide sequence of VGAM2315 RNA, herein designated VGAM RNA, also designated SEQ ID:5026.

[78712] Another function of VGAM2315 is therefore inhibition of UDP-glucose Dehydrogenase (UGDH, Accession NM_003359), a gene which is an UDP-glucose dehydrogenase. Accordingly, utilities of VGAM2315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGDH. The function of UGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.FLJ23259 (Accession NM_024727) is another VGAM2315 host target gene. FLJ23259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23259 BINDING SITE, designated SEQ ID:24063, to the nucleotide sequence of VGAM2315 RNA, herein designated VGAM RNA, also designated SEQ ID:5026.

[78713] Another function of VGAM2315 is therefore inhibition of

FLJ23259 (Accession NM_024727). Accordingly, utilities of VGAM2315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2316 (VGAM2316) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78714] VGAM2316 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2316 was detected is described hereinabove with reference to Figs. 1-8.

[78715] VGAM2316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78716] VGAM2316 gene encodes a VGAM2316 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2316 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2316 precursor RNA is designated SEQ ID:2302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2302 is located at position 33473 relative to the genome of Rana Tigrina Ranavirus.

[78717] VGAM2316 precursor RNA folds onto itself, forming VGAM2316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78718] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2316 folded precursor RNA into VGAM2316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM2316 RNA is designated SEQ ID:5027, and is provided hereinbelow with reference to the sequence listing part.

[78719] VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2316 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78720] VGAM2316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2316 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78721] The complementary binding of VGAM2316 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2316 host target RNA into VGAM2316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78722] It is appreciated that VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2316 host target genes. The mRNA of each one of this plurality of VGAM2316 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2316 RNA, herein designated VGAM RNA, and which when bound by VGAM2316 RNA causes inhibition of translation of respective one or more VGAM2316 host target proteins.

[78723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2316 gene, herein designated VGAM GENE, on one or more VGAM2316 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78724] It is yet further appreciated that a function of VGAM2316

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2316 correlate with, and may be deduced from, the identity of the host target genes which VGAM2316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78725] Nucleotide sequences of the VGAM2316 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2316 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2316 are further described hereinbelow with reference to Table 1.

[78726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2316 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2316 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78727] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2316 gene, herein designated VGAM is inhibition of expression of VGAM2316 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2316 correlate with, and may be deduced from, the identity of the target genes which VGAM2316 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78728] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497) is a VGAM2316 host target gene. B4GALT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT1 BINDING SITE, designated SEQ ID:7248, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78729] A function of VGAM2316 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497). Accordingly, utilities of VGAM2316 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with B4GALT1. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004013) is another VGAM2316 host target gene. DMD BINDING SITE1 through DMD BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE3, designated SEQ ID:10200, SEQ ID:10227 and SEQ ID:10239 respectively, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78730] Another function of VGAM2316 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004013), a gene which muscular dystrophy . Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM218.Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_022972) is another VGAM2316 host target gene. FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6, designated SEQ ID:23245, SEQ ID:23292, SEQ ID:5642, SEQ ID:23298, SEQ ID:23304 and SEQ ID:13672 respectively, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78731] Another function of VGAM2316 is therefore inhibition of Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_022972). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with FGFR2. PART1 (Accession NM_016590) is another VGAM2316 host target gene. PART1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PART1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PART1 BINDING SITE, designated SEQ ID:18667, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78732] Another function of VGAM2316 is therefore inhibition of PART1 (Accession NM_016590). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PART1. Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_000962) is another VGAM2316 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:6676 and SEQ ID:27897 respectively, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78733] Another function of VGAM2316 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_000962), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224.FLJ22174 (Accession NM_021945) is another VGAM2316 host target gene. FLJ22174 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ22174 BINDING SITE, designated SEQ ID:22468, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78734] Another function of VGAM2316 is therefore inhibition of FLJ22174 (Accession NM_021945). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22174. KIAA0222 (Accession NM_014643) is another VGAM2316 host target gene. KIAA0222 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0222 BINDING SITE, designated SEQ ID:16048, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78735] Another function of VGAM2316 is therefore inhibition of KIAA0222 (Accession NM_014643). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0222. RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979) is another VGAM2316 host target

gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:41282, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78736] Another function of VGAM2316 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM_170638) is another VGAM2316 host target gene. SEMA4G BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEMA4G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4G BINDING SITE,

designated SEQ ID:45411, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78737] Another function of VGAM2316 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM_170638). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4G. ZAK (Accession NM_016653) is another VGAM2316 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:18776, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78738] Another function of VGAM2316 is therefore inhibition of ZAK (Accession NM_016653). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK.

LOC131363 (Accession XM_067344) is another VGAM2316 host target gene. LOC131363 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC131363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131363 BINDING SITE, designated SEQ ID:37353, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78739] Another function of VGAM2316 is therefore inhibition of LOC131363 (Accession XM_067344). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131363. LOC147057 (Accession XM_097166) is another VGAM2316 host target gene. LOC147057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147057 BINDING SITE, designated SEQ ID:40785, to the nucleotide sequence of VGAM2316 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5027.

[78740] Another function of VGAM2316 is therefore inhibition of LOC147057 (Accession XM_097166). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147057. LOC152580 (Accession XM_098240) is another VGAM2316 host target gene. LOC152580 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152580 BINDING SITE, designated SEQ ID:41521, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78741] Another function of VGAM2316 is therefore inhibition of LOC152580 (Accession XM_098240). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152580. LOC221751 (Accession XM_166370) is another VGAM2316 host target gene. LOC221751 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221751, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221751 BINDING SITE, designated SEQ ID:44191, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78742] Another function of VGAM2316 is therefore inhibition of LOC221751 (Accession XM_166370). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221751. LOC89932 (Accession XM_027341) is another VGAM2316 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30495, to the nucleotide sequence of VGAM2316 RNA, herein designated VGAM RNA, also designated SEQ ID:5027.

[78743] Another function of VGAM2316 is therefore inhibition of LOC89932 (Accession XM_027341). Accordingly, utilities of VGAM2316 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC89932. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2317 (VGAM2317) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78744] VGAM2317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2317 was detected is described hereinabove with reference to Figs. 1-8.

[78745] VGAM2317 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2317 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78746] VGAM2317 gene encodes a VGAM2317 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2317 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2317 precursor RNA is desig-

nated SEQ ID:2303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2303 is located at position 24685 relative to the genome of Rana Tigrina Ranavirus.

[78747] VGAM2317 precursor RNA folds onto itself, forming VGAM2317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78748] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2317 folded precursor RNA into VGAM2317 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2317 RNA is designated SEQ ID:5028, and is provided hereinbelow with reference to the sequence

listing part.

[78749] VGAM2317 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2317 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78750] VGAM2317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2317 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2317 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78751] The complementary binding of VGAM2317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2317 host target RNA into VGAM2317 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78752] It is appreciated that VGAM2317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2317 host target genes. The mRNA of each one of this plurality of VGAM2317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2317 RNA, herein designated VGAM

RNA, and which when bound by VGAM2317 RNA causes inhibition of translation of respective one or more VGAM2317 host target proteins.

[78753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2317 gene, herein designated VGAM GENE, on one or more VGAM2317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78754] It is yet further appreciated that a function of VGAM2317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2317 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2317 correlate with, and may be deduced from, the identity of the host target genes which VGAM2317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78755] Nucleotide sequences of the VGAM2317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2317 are further described hereinbelow with reference to Table 1.

[78756] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2317 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78757] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2317 gene, herein designated VGAM is

inhibition of expression of VGAM2317 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2317 correlate with, and may be deduced from, the identity of the target genes which VGAM2317 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78758] Carbohydrate Kinase-like (CARKL, Accession NM_013276) is a VGAM2317 host target gene. CARKL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARKL BINDING SITE, designated SEQ ID:14937, to the nucleotide sequence of VGAM2317 RNA, herein designated VGAM RNA, also designated SEQ ID:5028.

[78759] A function of VGAM2317 is therefore inhibition of Carbohydrate Kinase-like (CARKL, Accession NM_013276), a gene which is a putative carbohydrate kinase and may be a modifier for the cystinosis phenotype. Accordingly, utilities of VGAM2317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARKL. The function of CARKL and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.Mitogen-activated Protein Kinase Kinase Kinase 11 (MAP3K11, Accession NM_002419) is another VGAM2317 host target gene. MAP3K11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP3K11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K11 BINDING SITE, designated SEQ ID:8256, to the nucleotide sequence of VGAM2317 RNA, herein designated VGAM RNA, also designated SEQ ID:5028.

[78760] Another function of VGAM2317 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 11 (MAP3K11, Accession NM_002419), a gene which is a PROTEIN-TYROSINE KINASE. Accordingly, utilities of VGAM2317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K11. The function of MAP3K11 has been established by previous studies. Using RT-PCR and cDNA library screening, Ing et al. (1994) identified MAP3K11, a novel protein kinase, from human thymus. The deduced open

reading frame, derived from sequencing a 3.5-kb MAP3K11 cDNA, encodes a protein of 847 amino acids with several interesting structural features. These include an SH3 domain in the absence of an SH2 domain, a region containing 2 leucine zippers with an adjacent C-terminal basic region, and a proline rich region. The new kinase showed homology with the mixed-lineage family of protein kinases (MLKs) and shared the unusual leucine zipper-basic motif found in previously identified MLK kinases; Ing et al. (1994) therefore called the protein MLK3. By Northern blot analysis, MAP3K11 mRNA was detected in a wide variety of normal and transformed human cell lines and tissues. SH2 domains refer to src homology 2 domains, which were first identified in the SRC gene family and found in a variety of proteins involved in signal transduction. Proteins bearing an SH3 domain also participate in receptor tyrosine kinase-mediated signal transduction. Using fluorescence in situ hybridization, Ing et al. (1994) mapped the MAP3K11 gene to 11q13.1-q13.3. Courseaux et al. (1996) used a combination of methods to refine maps of the approximately 5-Mb region of 11q13 that includes MEN1 (OMIM Ref. No. 131100). They proposed the following gene order: cen-

-

PGA-

-

FTH1--UGB--AHNAK--ROM1--MDU1--CHRM1--COX8--EMK1--FKBP2--PLCB3--[PYGM, ZFM1]--FAU--CAPN1--[MAP3K11, RELA]--FOSL1--SEA--CFL1--tel

[78761] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78762] Courseaux, A.; Grosgeorge, J.; Gaudray, P.; Pannett, A. A. J.; Forbes, S. A.; Williamson, C.; Bassett, D.; Thakker, R. V.; Teh, B. T.; Farnebo, F.; Shepherd, J.; Skogseid, B.; Larsson, C.; Giraud, S.; Zhang, C. X.; Salandre, J.; Calender, A. : Definition of the minimal MEN1 candidate area based on a 5-Mb integrated map of proximal 11q13. Genomics 37: 354-365, 1996. ; and

[78763] Ing, Y. L.; Leung, I. W. L.; Heng, H. H. Q.; Tsui, L.-C.; Lassam, N. J. : MLK-3: identification of a widely-expressed protein kinase bearing an SH3 domain and a leucine zipper-basic regi.

[78764] Further studies establishing the function and utilities of MAP3K11 are found in John Hopkins OMIM database

record ID 600050, and in sited publications numbered 398 and 7725 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.P114-RHO-GEF (Accession NM_015318) is another VGAM2317 host target gene. P114-RHO-GEF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P114-RHO-GEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P114-RHO-GEF BINDING SITE, designated SEQ ID:17639, to the nucleotide sequence of VGAM2317 RNA, herein designated VGAM RNA, also designated SEQ ID:5028.

[78765] Another function of VGAM2317 is therefore inhibition of P114-RHO-GEF (Accession NM_015318). Accordingly, utilities of VGAM2317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P114-RHO-GEF. LOC144347 (Accession XM_084832) is another VGAM2317 host target gene. LOC144347 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144347, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144347 BINDING SITE, designated SEQ ID:37722, to the nucleotide sequence of VGAM2317 RNA, herein designated VGAM RNA, also designated SEQ ID:5028.

[78766] Another function of VGAM2317 is therefore inhibition of LOC144347 (Accession XM_084832). Accordingly, utilities of VGAM2317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144347. LOC146243 (Accession XM_096956) is another VGAM2317 host target gene. LOC146243 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE, designated SEQ ID:40675, to the nucleotide sequence of VGAM2317 RNA, herein designated VGAM RNA, also designated SEQ ID:5028.

[78767] Another function of VGAM2317 is therefore inhibition of LOC146243 (Accession XM_096956). Accordingly, utilities of VGAM2317 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146243. LOC255231 (Accession XM_170908) is another VGAM2317 host target gene. LOC255231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255231 BINDING SITE, designated SEQ ID:45673, to the nucleotide sequence of VGAM2317 RNA, herein designated VGAM RNA, also designated SEQ ID:5028.

[78768] Another function of VGAM2317 is therefore inhibition of LOC255231 (Accession XM_170908). Accordingly, utilities of VGAM2317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2318 (VGAM2318) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78769] VGAM2318 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2318 was detected is described hereinabove with reference to Figs. 1-8.

[78770] VGAM2318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78771] VGAM2318 gene encodes a VGAM2318 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2318 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2318 precursor RNA is designated SEQ ID:2304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2304 is located at position 35010 relative to the genome of Rana Tigrina Ranavirus.

[78772] VGAM2318 precursor RNA folds onto itself, forming VGAM2318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78773] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2318 folded precursor RNA into VGAM2318 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2318 RNA is designated SEQ ID:5029, and is provided hereinbelow with reference to the sequence listing part.

[78774] VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2318 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78775] VGAM2318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2318 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2318 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78776] The complementary binding of VGAM2318 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2318 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2318 host target RNA into VGAM2318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78777] It is appreciated that VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2318 host target genes. The mRNA of each one of this plurality of VGAM2318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2318 RNA, herein designated VGAM RNA, and which when bound by VGAM2318 RNA causes inhibition of translation of respective one or more VGAM2318 host target proteins.

[78778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2318 gene, herein designated VGAM GENE, on one or more VGAM2318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78779] It is yet further appreciated that a function of VGAM2318 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2318 correlate with, and may be deduced from, the identity of the host target genes which VGAM2318 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78780] Nucleotide sequences of the VGAM2318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2318 are further described hereinbelow with reference to Table 1.

[78781] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2318 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78782] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2318 gene, herein designated VGAM is inhibition of expression of VGAM2318 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2318 correlate with, and may be deduced from, the identity of the target genes which VGAM2318 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78783] Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is a VGAM2318 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10694, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78784] A function of VGAM2318 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.Ephrin-B1 (EFNB1, Accession NM_004429) is another VGAM2318 host target gene. EFNB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB1 BINDING SITE, designated SEQ

ID:10707, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78785] Another function of VGAM2318 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM_004429), a gene which is a transmembrane ligand of Eph-related receptor tyrosine kinases, has a role in cell adhesion. Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB1. The function of EFNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390.LIM Homeobox Protein 5 (LHX5, Accession NM_022363) is another VGAM2318 host target gene. LHX5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LHX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX5 BINDING SITE, designated SEQ ID:22749, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78786] Another function of VGAM2318 is therefore inhibition of

LIM Homeobox Protein 5 (LHX5, Accession NM_022363). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX5. Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_001879) is another VGAM2318 host target gene. MASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:7606, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78787] Another function of VGAM2318 is therefore inhibition of Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_001879), a gene which a complement-dependent bactericidal factor . Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1. The function of MASP1 and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM566.Myogenin (myogenic factor 4) (MYOG, Accession XM_001688) is another VGAM2318 host target gene. MYOG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYOG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYOG BINDING SITE, designated SEQ ID:29847, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78788] Another function of VGAM2318 is therefore inhibition of Myogenin (myogenic factor 4) (MYOG, Accession XM_001688), a gene which can induce myogenesis in a variety of cell types. Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYOG. The function of MYOG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1793.Polypyrimidine Tract Binding Protein 1 (PTBP1,

Accession NM_002819) is another VGAM2318 host target gene. PTBP1 BINDING SITE1 and PTBP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTBP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTBP1 BINDING SITE1 and PTBP1 BINDING SITE2, designated SEQ ID:8684 and SEQ ID:25704 respectively, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78789] Another function of VGAM2318 is therefore inhibition of Polypyrimidine Tract Binding Protein 1 (PTBP1, Accession NM_002819), a gene which is required for pre-mRNA splicing, and acts via the protein degradation ubiquitin-proteasome pathway. Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTBP1. The function of PTBP1 has been established by previous studies. Polypyrimidine tract-binding protein (PTB), also known as heterogeneous nuclear ribonucleoprotein type I (hnRNP I), is a 59.6-kD nuclear protein that binds pre-mRNAs in specific regions of the hnRNA-protein complexes sensitive

to micrococcal nuclease. The hnRNP I protein shows an unusual pattern of nuclear localization (Ghetti et al., 1992). It has been implicated in pre-mRNA splicing. Inclusion of cardiac troponin T (TNNT2; 191045) exon 5 in embryonic muscle requires conserved flanking intronic elements (MSEs). Charlet-B. et al. (2002) found that ETR3 (CUGBP2; 602538), a member of the CELF family, binds U/G motifs in 2 MSEs and directly activates exon inclusion in vitro. They showed that binding and activation by ETR3 are directly antagonized by PTB. The use of dominant-negative mutants demonstrated that endogenous CELF and PTB activities are required for MSE-dependent activation and repression in muscle and nonmuscle cells, respectively. Combined use of CELF and PTB dominant-negative mutants provided an in vivo demonstration that antagonistic splicing activities exist within the same cells.

[78790] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78791] Ghetti, A.; Pinol-Roma, S.; Michael, W. M.; Morandi, C.; Dreyfuss, G. : HNRNP I, the polypyrimidine tract-binding protein: distinct nuclear localization and association with hnRNAs. Nucleic Acids Res. 20: 3671-3678, 1992. ; and

[78792] Charlet-B., N.; Logan, P.; Singh, G.; Cooper, T. A. : Dynamic antagonism between ETR-3 and PTB regulates cell type-specific alternative splicing. Molec. Cell 9: 649-658, 2002.

[78793] Further studies establishing the function and utilities of PTBP1 are found in John Hopkins OMIM database record ID 600693, and in sited publications numbered 10492-9983 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.ADP-ribosylation Factor GTPase Activating Protein 1 (ARFGAP1, Accession NM_018209) is another VGAM2318 host target gene. ARFGAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARFGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFGAP1 BINDING SITE, designated SEQ ID:20108, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78794] Another function of VGAM2318 is therefore inhibition of ADP-ribosylation Factor GTPase Activating Protein 1 (ARFGAP1, Accession NM_018209). Accordingly, utilities

of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFGAP1. Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_032966) is another VGAM2318 host target gene. BLR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLR1 BINDING SITE, designated SEQ ID:26775, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78795] Another function of VGAM2318 is therefore inhibition of Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_032966). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLR1. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728) is another VGAM2318 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38837, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78796] Another function of VGAM2318 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. Collagen, Type IV, Alpha 3 (Goodpasture antigen) Binding Protein (COL4A3BP, Accession NM_005713) is another VGAM2318 host target gene. COL4A3BP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by COL4A3BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A3BP BINDING SITE, designated SEQ ID:12266, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78797] Another function of VGAM2318 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) Binding Protein (COL4A3BP, Accession NM_005713). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3BP. Cathepsin O (CTSO, Accession NM_001334) is another VGAM2318 host target gene. CTSO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTSO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSO BINDING SITE, designated SEQ ID:7016, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78798] Another function of VGAM2318 is therefore inhibition of Cathepsin O (CTSO, Accession NM_001334). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSO. FLJ10743 (Accession NM_018201) is another VGAM2318 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10743, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20077, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78799] Another function of VGAM2318 is therefore inhibition of FLJ10743 (Accession NM_018201). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743. FLJ14124 (Accession NM_024868) is another VGAM2318 host target gene. FLJ14124 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14124 BINDING SITE, designated SEQ ID:24304, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78800] Another function of VGAM2318 is therefore inhibition of FLJ14124 (Accession NM_024868). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14124. FLJ14824 (Accession NM_032846) is another VGAM2318 host target gene. FLJ14824 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14824 BINDING SITE, designated SEQ ID:26641, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78801] Another function of VGAM2318 is therefore inhibition of FLJ14824 (Accession NM_032846). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14824. HSU79303 (Accession NM_013301) is another VGAM2318 host target gene. HSU79303 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSU79303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU79303 BINDING SITE, designated SEQ ID:14960, to the

nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78802] Another function of VGAM2318 is therefore inhibition of HSU79303 (Accession NM_013301). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU79303. ICB-1 (Accession NM_004848) is another VGAM2318 host target gene. ICB-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICB-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICB-1 BINDING SITE, designated SEQ ID:11258, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78803] Another function of VGAM2318 is therefore inhibition of ICB-1 (Accession NM_004848). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICB-1. KIAA0010 (Accession NM_014671) is another VGAM2318 host target gene. KIAA0010 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by KIAA0010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0010 BINDING SITE, designated SEQ ID:16129, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78804] Another function of VGAM2318 is therefore inhibition of KIAA0010 (Accession NM_014671). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0010. KIAA0121 (Accession XM_052386) is another VGAM2318 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35969, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78805] Another function of VGAM2318 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities

of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0194 (Accession XM_038362) is another VGAM2318 host target gene. KIAA0194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0194 BINDING SITE, designated SEQ ID:32822, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78806] Another function of VGAM2318 is therefore inhibition of KIAA0194 (Accession XM_038362). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0194. KIAA1691 (Accession XM_166523) is another VGAM2318 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1691 BINDING SITE, designated SEQ ID:44467, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78807] Another function of VGAM2318 is therefore inhibition of KIAA1691 (Accession XM_166523). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM_044799) is another VGAM2318 host target gene. NGEF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NGEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGEF BINDING SITE, designated SEQ ID:34276, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78808] Another function of VGAM2318 is therefore inhibition of Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM_044799). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGEF. REPRIMO

(Accession NM_019845) is another VGAM2318 host target gene. REPRIMO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by REPRIMO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REPRIMO BINDING SITE, designated SEQ ID:21248, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78809] Another function of VGAM2318 is therefore inhibition of REPRIMO (Accession NM_019845). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REPRIMO. ZF5128 (Accession NM_014347) is another VGAM2318 host target gene. ZF5128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZF5128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF5128 BINDING SITE, designated SEQ ID:15669, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM

RNA, also designated SEQ ID:5029.

[78810] Another function of VGAM2318 is therefore inhibition of ZF5128 (Accession NM_014347). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF5128. LOC147136 (Accession XM_085716) is another VGAM2318 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38302, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78811] Another function of VGAM2318 is therefore inhibition of LOC147136 (Accession XM_085716). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC153196 (Accession XM_098323) is another VGAM2318 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153196, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41589, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78812] Another function of VGAM2318 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC158654 (Accession XM_088632) is another VGAM2318 host target gene. LOC158654 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158654 BINDING SITE, designated SEQ ID:39877, to the nucleotide sequence of VGAM2318 RNA, herein designated VGAM RNA, also designated SEQ ID:5029.

[78813] Another function of VGAM2318 is therefore inhibition of LOC158654 (Accession XM_088632). Accordingly, utilities of VGAM2318 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158654. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2319 (VGAM2319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78814] VGAM2319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2319 was detected is described hereinabove with reference to Figs. 1-8.

[78815] VGAM2319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78816] VGAM2319 gene encodes a VGAM2319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2319 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2319 precursor RNA is desig-

nated SEQ ID:2305, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2305 is located at position 15762 relative to the genome of Rana Tigrina Ranavirus.

[78817] VGAM2319 precursor RNA folds onto itself, forming VGAM2319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78818] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2319 folded precursor RNA into VGAM2319 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2319 RNA is designated SEQ ID:5030, and is provided hereinbelow with reference to the sequence

listing part.

[78819] VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2319 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78820] VGAM2319 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2319 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2319 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78821] The complementary binding of VGAM2319 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2319 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2319 host target RNA into VGAM2319 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78822] It is appreciated that VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2319 host target genes. The mRNA of each one of this plurality of VGAM2319 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2319 RNA, herein designated VGAM

RNA, and which when bound by VGAM2319 RNA causes inhibition of translation of respective one or more VGAM2319 host target proteins.

[78823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2319 gene, herein designated VGAM GENE, on one or more VGAM2319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78824] It is yet further appreciated that a function of VGAM2319 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2319 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2319 correlate with, and may be deduced from, the identity of the host target genes which VGAM2319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78825] Nucleotide sequences of the VGAM2319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2319 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2319 are further described hereinbelow with reference to Table 1.

[78826] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2319 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78827] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2319 gene, herein designated VGAM is

inhibition of expression of VGAM2319 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2319 correlate with, and may be deduced from, the identity of the target genes which VGAM2319 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78828] Protein Tyrosine Phosphatase, Non-receptor Type 18 (brain-derived) (PTPN18, Accession NM_014369) is a VGAM2319 host target gene. PTPN18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPN18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN18 BINDING SITE, designated SEQ ID:15704, to the nucleotide sequence of VGAM2319 RNA, herein designated VGAM RNA, also designated SEQ ID:5030.

[78829] A function of VGAM2319 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 18 (brain-derived) (PTPN18, Accession NM_014369). Accordingly, utilities of VGAM2319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN18. Tumor Necrosis Factor Receptor Super-

family, Member 11a, Activator of NFKB (TNFRSF11A, Accession NM_003839) is another VGAM2319 host target gene. TNFRSF11A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF11A BINDING SITE, designated SEQ ID:9932, to the nucleotide sequence of VGAM2319 RNA, herein designated VGAM RNA, also designated SEQ ID:5030.

[78830] Another function of VGAM2319 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 11a, Activator of NFKB (TNFRSF11A, Accession NM_003839). Accordingly, utilities of VGAM2319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF11A. AFAP (Accession NM_021638) is another VGAM2319 host target gene. AFAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of AFAP BINDING SITE, designated SEQ ID:22293, to the nucleotide sequence of VGAM2319 RNA, herein designated VGAM RNA, also designated SEQ ID:5030.

[78831] Another function of VGAM2319 is therefore inhibition of AFAP (Accession NM_021638). Accordingly, utilities of VGAM2319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. LOC221362 (Accession XM_168093) is another VGAM2319 host target gene. LOC221362 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221362 BINDING SITE, designated SEQ ID:45022, to the nucleotide sequence of VGAM2319 RNA, herein designated VGAM RNA, also designated SEQ ID:5030.

[78832] Another function of VGAM2319 is therefore inhibition of LOC221362 (Accession XM_168093). Accordingly, utilities of VGAM2319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221362. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2320 (VGAM2320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78833] VGAM2320 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2320 was detected is described hereinabove with reference to Figs. 1-8.

[78834] VGAM2320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78835] VGAM2320 gene encodes a VGAM2320 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2320 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2320 precursor RNA is designated SEQ ID:2306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2306 is located at position 28526 relative to the

genome of Rana Tigrina Ranavirus.

[78836] VGAM2320 precursor RNA folds onto itself, forming VGAM2320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78837] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2320 folded precursor RNA into VGAM2320 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2320 RNA is designated SEQ ID:5031, and is provided hereinbelow with reference to the sequence listing part.

[78838] VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2320 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78839] VGAM2320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2320 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78840] The complementary binding of VGAM2320 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2320 host target RNA into VGAM2320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78841] It is appreciated that VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2320 host target genes. The mRNA of each one of this plurality of VGAM2320 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2320 RNA, herein designated VGAM RNA, and which when bound by VGAM2320 RNA causes inhibition of translation of respective one or more VGAM2320 host target proteins.

[78842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2320 gene, herein designated VGAM GENE, on one or more VGAM2320 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78843] It is yet further appreciated that a function of VGAM2320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2320

correlate with, and may be deduced from, the identity of the host target genes which VGAM2320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78844] Nucleotide sequences of the VGAM2320 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2320 are further described hereinbelow with reference to Table 1.

[78845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2320 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78846] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2320 gene, herein designated VGAM is inhibition of expression of VGAM2320 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2320 correlate with, and may be deduced

from, the identity of the target genes which VGAM2320 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78847] DEK Oncogene (DNA binding) (DEK, Accession NM_003472) is a VGAM2320 host target gene. DEK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DEK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEK BINDING SITE, designated SEQ ID:9537, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78848] A function of VGAM2320 is therefore inhibition of DEK Oncogene (DNA binding) (DEK, Accession NM_003472), a gene which interacts in transcriptional regulation and signal transduction. Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEK. The function of DEK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795.Hemochromatosis (HFE, Accession NM_139004)

is another VGAM2320 host target gene. HFE BINDING SITE1 through HFE BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HFE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HFE BINDING SITE1 through HFE BINDING SITE6, designated SEQ ID:29098, SEQ ID:29100, SEQ ID:29101, SEQ ID:29102, SEQ ID:29103 and SEQ ID:5984 respectively, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78849] Another function of VGAM2320 is therefore inhibition of Hemochromatosis (HFE, Accession NM_139004). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HFE. Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_000021) is another VGAM2320 host target gene. PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSEN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2, designated SEQ ID:5456 and SEQ ID:25335 respectively, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78850] Another function of VGAM2320 is therefore inhibition of Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_000021). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN1. FLJ14640 (Accession NM_032816) is another VGAM2320 host target gene. FLJ14640 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14640, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14640 BINDING SITE, designated SEQ ID:26585, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78851] Another function of VGAM2320 is therefore inhibition of FLJ14640 (Accession NM_032816). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14640. FLJ22635 (Accession NM_025092) is another VGAM2320 host target gene. FLJ22635 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22635 BINDING SITE, designated SEQ ID:24715, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78852] Another function of VGAM2320 is therefore inhibition of FLJ22635 (Accession NM_025092). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22635. GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412) is another VGAM2320 host target gene. GABARAPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GABARAPL1 BINDING SITE, designated SEQ ID:25389, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78853] Another function of VGAM2320 is therefore inhibition of GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1. KIAA0441 (Accession NM_014797) is another VGAM2320 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16708, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78854] Another function of VGAM2320 is therefore inhibition of KIAA0441 (Accession NM_014797). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. KIAA0494 (Accession NM_014774) is another

VGAM2320 host target gene. KIAA0494 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16587, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78855] Another function of VGAM2320 is therefore inhibition of KIAA0494 (Accession NM_014774). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. MGC27277 (Accession NM_144989) is another VGAM2320 host target gene. MGC27277 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC27277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC27277 BINDING SITE, designated SEQ ID:29592, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78856] Another function of VGAM2320 is therefore inhibition of MGC27277 (Accession NM_144989). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27277. LOC129530 (Accession XM_059362) is another VGAM2320 host target gene. LOC129530 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC129530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129530 BINDING SITE, designated SEQ ID:36971, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78857] Another function of VGAM2320 is therefore inhibition of LOC129530 (Accession XM_059362). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129530. LOC145678 (Accession XM_096832) is another VGAM2320 host target gene. LOC145678 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145678, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145678 BINDING SITE, designated SEQ ID:40555, to the nucleotide sequence of VGAM2320 RNA, herein designated VGAM RNA, also designated SEQ ID:5031.

[78858] Another function of VGAM2320 is therefore inhibition of LOC145678 (Accession XM_096832). Accordingly, utilities of VGAM2320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145678. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2321 (VGAM2321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78859] VGAM2321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2321 was detected is described hereinabove with reference to Figs. 1-8.

[78860] VGAM2321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2321 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[78861] VGAM2321 gene encodes a VGAM2321 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2321 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2321 precursor RNA is designated SEQ ID:2307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2307 is located at position 24842 relative to the genome of Rana Tigrina Ranavirus.

[78862] VGAM2321 precursor RNA folds onto itself, forming VGAM2321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78863] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2321 folded precursor RNA into VGAM2321

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2321 RNA is designated SEQ ID:5032, and is provided hereinbelow with reference to the sequence listing part.

[78864] VGAM2321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2321 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78865] VGAM2321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2321 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2321 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78866] The complementary binding of VGAM2321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2321 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2321 host target RNA into VGAM2321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[78867] It is appreciated that VGAM2321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2321 host target genes. The mRNA of each one of this plurality of VGAM2321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2321 RNA, herein designated VGAM RNA, and which when bound by VGAM2321 RNA causes inhibition of translation of respective one or more VGAM2321 host target proteins.

[78868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2321 gene, herein designated VGAM GENE, on one or more VGAM2321 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78869] It is yet further appreciated that a function of VGAM2321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2321 correlate with, and may be deduced from, the identity of the host target genes which VGAM2321 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78870] Nucleotide sequences of the VGAM2321 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2321 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2321 are further described hereinbelow with reference to Table 1.

[78871] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2321 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2321 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78872] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2321 gene, herein designated VGAM is inhibition of expression of VGAM2321 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2321 correlate with, and may be deduced from, the identity of the target genes which VGAM2321 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78873] CD4 Antigen (p55) (CD4, Accession NM_000616) is a VGAM2321 host target gene. CD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD4 BINDING SITE, designated SEQ ID:6218, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5032.

[78874] A function of VGAM2321 is therefore inhibition of CD4 Antigen (p55) (CD4, Accession NM_000616), a gene which is T-cell surface glycoprotein and has role in cell-cell interactions and may act in signal transduction. Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD4. The function of CD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog K (avian) (MAFK, Accession NM_002360) is another VGAM2321 host target gene. MAFK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAFK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAFK BINDING SITE, designated SEQ ID:8172, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78875] Another function of VGAM2321 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Ho-

molog K (avian) (MAFK, Accession NM_002360), a gene which is involved in regulation of transcription at NEF2 sites. Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAFK. The function of MAFK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1505.Multiple Endocrine Neoplasia I (MEN1, Accession NM_130803) is another VGAM2321 host target gene. MEN1 BINDING SITE1 and MEN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE1 and MEN1 BINDING SITE2, designated SEQ ID:28298 and SEQ ID:28302 respectively, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78876] Another function of VGAM2321 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession NM_130803). Accordingly, utilities of VGAM2321 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Usher Syndrome 3A (USH3A, Accession NM_052995) is another VGAM2321 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:27562, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78877] Another function of VGAM2321 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM_052995). Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM_012384) is another VGAM2321 host target gene. GMEB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GMEB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of GMEB2 BINDING SITE, designated SEQ ID:14738, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78878] Another function of VGAM2321 is therefore inhibition of Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM_012384). Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMEB2. R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361) is another VGAM2321 host target gene. R3HDM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by R3HDM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of R3HDM BINDING SITE, designated SEQ ID:17662, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78879] Another function of VGAM2321 is therefore inhibition of R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM_015361). Accordingly,

utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with R3HDM. LOC145216 (Accession XM_096730) is another VGAM2321 host target gene. LOC145216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:40509, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78880] Another function of VGAM2321 is therefore inhibition of LOC145216 (Accession XM_096730). Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216. LOC148697 (Accession XM_086276) is another VGAM2321 host target gene. LOC148697 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148697 BINDING SITE, designated SEQ ID:38572, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78881] Another function of VGAM2321 is therefore inhibition of LOC148697 (Accession XM_086276). Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148697. LOC152580 (Accession XM_098240) is another VGAM2321 host target gene. LOC152580 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152580 BINDING SITE, designated SEQ ID:41523, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78882] Another function of VGAM2321 is therefore inhibition of LOC152580 (Accession XM_098240). Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152580. LOC254431 (Accession XM_173024) is another VGAM2321 host target gene. LOC254431 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254431 BINDING SITE, designated SEQ ID:46292, to the nucleotide sequence of VGAM2321 RNA, herein designated VGAM RNA, also designated SEQ ID:5032.

[78883] Another function of VGAM2321 is therefore inhibition of LOC254431 (Accession XM_173024). Accordingly, utilities of VGAM2321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254431. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2322 (VGAM2322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78884] VGAM2322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2322 was detected is described hereinabove with reference to Figs. 1-8.

[78885] VGAM2322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78886] VGAM2322 gene encodes a VGAM2322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2322 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2322 precursor RNA is designated SEQ ID:2308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2308 is located at position 49980 relative to the genome of Rana Tigrina Ranavirus.

[78887] VGAM2322 precursor RNA folds onto itself, forming VGAM2322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[78888] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2322 folded precursor RNA into VGAM2322 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2322 RNA is designated SEQ ID:5033, and is provided hereinbelow with reference to the sequence listing part.

[78889] VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2322 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78890] VGAM2322 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2322 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2322 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78891] The complementary binding of VGAM2322 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2322 host target RNA into VGAM2322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78892] It is appreciated that VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2322 host target genes. The mRNA of each one of this plurality of VGAM2322 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2322 RNA, herein designated VGAM RNA, and which when bound by VGAM2322 RNA causes inhibition of translation of respective one or more VGAM2322 host target proteins.

[78893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2322 gene, herein designated VGAM GENE, on one or more VGAM2322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78894] It is yet further appreciated that a function of VGAM2322 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2322 correlate with, and may be deduced from, the identity of the host target genes which VGAM2322 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78895] Nucleotide sequences of the VGAM2322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2322 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2322 are further described hereinbelow with reference to Table 1.

[78896] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2322 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2322 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78897] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2322 gene, herein designated VGAM is inhibition of expression of VGAM2322 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2322 correlate with, and may be deduced from, the identity of the target genes which VGAM2322 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78898] APG5 Autophagy 5-like (S. cerevisiae) (APG5L, Accession NM_004849) is a VGAM2322 host target gene. APG5L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APG5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of APG5L BINDING SITE, designated SEQ ID:11261, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78899] A function of VGAM2322 is therefore inhibition of APG5 Autophagy 5-like (S. cerevisiae) (APG5L, Accession NM_004849), a gene which conjugates to apg12 and associates with isolation membrane to form cup-shaped isolation membrane and autophagosome. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APG5L. The function of APG5L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492.UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776) is another VGAM2322 host target gene. B4GALT5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ

ID:11171, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78900] Another function of VGAM2322 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5. Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399) is another VGAM2322 host target gene. EGR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR2 BINDING SITE, designated SEQ ID:5970, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78901] Another function of VGAM2322 is therefore inhibition of Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399), a gene which binds to two specific dna sites located in the promoter region of hox-

1.4. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR2. The function of EGR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM234.FUS1 (Accession NM_007275) is another VGAM2322 host target gene. FUS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUS1 BINDING SITE, designated SEQ ID:14136, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78902] Another function of VGAM2322 is therefore inhibition of FUS1 (Accession NM_007275), a gene which may function as a tumor suppressor. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUS1. The function of FUS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM1246.Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM_033310) is another VGAM2322 host target gene. KCNK4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:27150, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78903] Another function of VGAM2322 is therefore inhibition of Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM_033310). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4. MUS81 (Accession NM_025128) is another VGAM2322 host target gene. MUS81 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MUS81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUS81 BINDING SITE, designated SEQ

ID:24771, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78904] Another function of VGAM2322 is therefore inhibition of MUS81 (Accession NM_025128). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUS81. Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM_045343) is another VGAM2322 host target gene. NBS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBS1 BINDING SITE, designated SEQ ID:34437, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78905] Another function of VGAM2322 is therefore inhibition of Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM_045343), a gene which may be involved in repair of DNA double-strand breaks. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBS1.

The function of NBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450.Numb Homolog (Drosophila) (NUMB, Accession NM_003744) is another VGAM2322 host target gene. NUMB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUMB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUMB BINDING SITE, designated SEQ ID:9832, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78906] Another function of VGAM2322 is therefore inhibition of Numb Homolog (Drosophila) (NUMB, Accession NM_003744), a gene which may act in generating asymmetric cell division during neurogenesisand is strongly similar to murine Numb. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMB. The function of NUMB has been established by previous studies. During Drosophila neurogenesis, differential partitioning of the 'Numb' (dNumb) gene product is necessary

for daughter cells to adopt distinct fates. Numb is thought to act by causing a bias in the cell-cell interaction mediated by Notch (see OMIM Ref. No. JAG2; 602570). Zhong et al. (1996) isolated cDNAs encoding mouse Numb (mNumb). The N-terminal region of the deduced 593-amino acid mouse protein contains a predicted phosphotyrosine-binding domain and shares 63% identity with dNumb. The C-terminal half shows little similarity with dNumb and includes a proline-rich segment with potential SH3-binding sites. Immunofluorescence experiments revealed that mNumb is asymmetrically localized to the apical membrane of dividing ventricular neural progenitors during mouse cortical neurogenesis. However, unlike dNumb, there was no correlation between cleavage planes and mNumb localization at the apical cell membrane in anaphase ventricular cells. Zhong et al. (1996) expressed mNumb in Drosophila embryos and found that it localized asymmetrically in dividing neural precursors and rescued the Numb mutant phenotype. Yeast 2-hybrid assays and in vitro binding experiments demonstrated that mNumb can physically interact with the intracellular domain of mouse Notch1 (OMIM Ref. No. 190198). The authors concluded that shared molecular mechanisms

generate asymmetric cell divisions during neurogenesis of vertebrates and invertebrates. Salcini et al. (1997) reported that both the NUMB and NUMB-like (NUMBL; 604018) proteins bind to the EH protein-protein interaction domain found in EPS15 (OMIM Ref. No. 600051) and other proteins. Coimmunoprecipitation studies demonstrated that NUMB and EPS15 are associated in vivo. This association appears to be mediated by an interaction between the EH domain of EPS15 and an asn-pro-phe (NPF) motif located near the C terminus of NUMB.

[78907] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78908] Salcini, A. E.; Confalonieri, S.; Doria, M.; Santolini, E.; Tassi, E.; Minenkova, O.; Cesareni, G.; Pelicci, P. G.; Di Fiore, P. P. : Binding specificity and in vivo targets of the EH domain, a novel protein-protein interaction module. Genes Dev. 11: 2239-2249, 1997. ; and

[78909] Zhong, W.; Feder, J. N.; Jiang, M.-M.; Jan, L. Y.; Jan, Y. N. : Asymmetric localization of a mammalian Numb homolog during mouse cortical neurogenesis. Neuron 17: 43-53, 1996.

[78910] Further studies establishing the function and utilities of

NUMB are found in John Hopkins OMIM database record ID 603728, and in sited publications numbered 7012-5839 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Oligophrenin 1 (OPHN1, Accession NM_002547) is another VGAM2322 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8398, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78911] Another function of VGAM2322 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM_002547). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. Protein Kinase C, Mu (PRKCM, Accession NM_002742) is another VGAM2322 host target gene. PRKCM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCM, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCM BINDING SITE, designated SEQ ID:8613, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78912] Another function of VGAM2322 is therefore inhibition of Protein Kinase C, Mu (PRKCM, Accession NM_002742). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCM. Retinoid X Receptor, Alpha (RXRA, Accession NM_002957) is another VGAM2322 host target gene. RXRA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RXRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:8868, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78913] Another function of VGAM2322 is therefore inhibition of Retinoid X Receptor, Alpha (RXRA, Accession NM_002957), a gene which activates genes required for vitamin A

metabolism, binds 9-cis retinoic acid. Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRA. The function of RXRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349.SIP (Accession NM_014412) is another VGAM2322 host target gene. SIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIP BINDING SITE, designated SEQ ID:15756, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78914] Another function of VGAM2322 is therefore inhibition of SIP (Accession NM_014412). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIP. Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM_007222) is another VGAM2322 host target gene. ZHX1 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by ZHX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZHX1 BINDING SITE, designated SEQ ID:14090, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78915] Another function of VGAM2322 is therefore inhibition of Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM_007222). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZHX1. FLJ20257 (Accession NM_019606) is another VGAM2322 host target gene. FLJ20257 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20257 BINDING SITE, designated SEQ ID:21219, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78916] Another function of VGAM2322 is therefore inhibition of

FLJ20257 (Accession NM_019606). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20257. FLJ21865 (Accession NM_022759) is another VGAM2322 host target gene. FLJ21865 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21865 BINDING SITE, designated SEQ ID:22999, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78917] Another function of VGAM2322 is therefore inhibition of FLJ21865 (Accession NM_022759). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21865. FLJ22160 (Accession NM_024585) is another VGAM2322 host target gene. FLJ22160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ22160 BINDING SITE, designated SEQ ID:23821, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78918] Another function of VGAM2322 is therefore inhibition of FLJ22160 (Accession NM_024585). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22160. KIAA1328 (Accession XM_029429) is another VGAM2322 host target gene. KIAA1328 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1328 BINDING SITE, designated SEQ ID:30887, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78919] Another function of VGAM2322 is therefore inhibition of KIAA1328 (Accession XM_029429). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1328. KIAA1354 (Accession XM_027604) is another

VGAM2322 host target gene. KIAA1354 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1354 BINDING SITE, designated SEQ ID:30539, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78920] Another function of VGAM2322 is therefore inhibition of KIAA1354 (Accession XM_027604). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1354. KIAA1554 (Accession XM_170834) is another VGAM2322 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45611, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78921] Another function of VGAM2322 is therefore inhibition of KIAA1554 (Accession XM_170834). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. OS4 (Accession NM_005730) is another VGAM2322 host target gene. OS4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS4 BINDING SITE, designated SEQ ID:12288, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78922] Another function of VGAM2322 is therefore inhibition of OS4 (Accession NM_005730). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS4. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550) is another VGAM2322 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17812, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78923] Another function of VGAM2322 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. PRO0365 (Accession NM_014126) is another VGAM2322 host target gene. PRO0365 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0365, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15384, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78924] Another function of VGAM2322 is therefore inhibition of PRO0365 (Accession NM_014126). Accordingly, utilities of

VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365. RAB20, Member RAS Oncogene Family (RAB20, Accession NM_017817) is another VGAM2322 host target gene. RAB20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB20 BINDING SITE, designated SEQ ID:19465, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78925] Another function of VGAM2322 is therefore inhibition of RAB20, Member RAS Oncogene Family (RAB20, Accession NM_017817). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB20. TRIP-Br2 (Accession NM_014755) is another VGAM2322 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16480, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78926] Another function of VGAM2322 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC118978 (Accession XM_071677) is another VGAM2322 host target gene. LOC118978 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118978 BINDING SITE, designated SEQ ID:37412, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78927] Another function of VGAM2322 is therefore inhibition of LOC118978 (Accession XM_071677). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC118978. LOC159110 (Accession XM_088753) is another VGAM2322 host target gene. LOC159110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC159110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159110 BINDING SITE, designated SEQ ID:39943, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78928] Another function of VGAM2322 is therefore inhibition of LOC159110 (Accession XM_088753). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159110. LOC159116 (Accession XM_088752) is another VGAM2322 host target gene. LOC159116 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC159116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159116 BINDING SITE, designated SEQ ID:39941, to the nucleotide sequence of VGAM2322 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5033.

[78929] Another function of VGAM2322 is therefore inhibition of LOC159116 (Accession XM_088752). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159116. LOC203221 (Accession XM_116795) is another VGAM2322 host target gene. LOC203221 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203221 BINDING SITE, designated SEQ ID:43126, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78930] Another function of VGAM2322 is therefore inhibition of LOC203221 (Accession XM_116795). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203221. LOC90844 (Accession XM_034434) is another VGAM2322 host target gene. LOC90844 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90844, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90844 BINDING SITE, designated SEQ ID:32118, to the nucleotide sequence of VGAM2322 RNA, herein designated VGAM RNA, also designated SEQ ID:5033.

[78931] Another function of VGAM2322 is therefore inhibition of LOC90844 (Accession XM_034434). Accordingly, utilities of VGAM2322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90844. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2323 (VGAM2323) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78932] VGAM2323 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2323 was detected is described hereinabove with reference to Figs. 1-8.

[78933] VGAM2323 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus.

VGAM2323 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78934] VGAM2323 gene encodes a VGAM2323 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2323 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2323 precursor RNA is designated SEQ ID:2309, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2309 is located at position 27691 relative to the genome of Rana Tigrina Ranavirus.

[78935] VGAM2323 precursor RNA folds onto itself, forming VGAM2323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78936] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2323 folded precursor RNA into VGAM2323 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2323 RNA is designated SEQ ID:5034, and is provided hereinbelow with reference to the sequence listing part.

[78937] VGAM2323 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2323 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78938] VGAM2323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2323 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78939] The complementary binding of VGAM2323 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2323 host target RNA into VGAM2323 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78940] It is appreciated that VGAM2323 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2323 host target genes. The mRNA of each one of this plurality of VGAM2323 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2323 RNA, herein designated VGAM RNA, and which when bound by VGAM2323 RNA causes inhibition of translation of respective one or more VGAM2323 host target proteins.

[78941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2323 gene, herein designated VGAM GENE, on one or more VGAM2323 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78942] It is yet further appreciated that a function of VGAM2323 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2323 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2323 correlate with, and may be deduced from, the identity of the host target genes which VGAM2323 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78943] Nucleotide sequences of the VGAM2323 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2323 are further described hereinbelow with reference to Table 1.

[78944] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2323 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78945] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2323 gene, herein designated VGAM is inhibition of expression of VGAM2323 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2323 correlate with, and may be deduced from, the identity of the target genes which VGAM2323 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78946] KIAA0620 (Accession XM_030707) is a VGAM2323 host target gene. KIAA0620 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0620 BINDING SITE, designated SEQ ID:31120, to the nucleotide sequence of

VGAM2323 RNA, herein designated VGAM RNA, also designated SEQ ID:5034.

[78947] A function of VGAM2323 is therefore inhibition of KIAA0620 (Accession XM_030707). Accordingly, utilities of VGAM2323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0620. KIAA1023 (Accession NM_017604) is another VGAM2323 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19087, to the nucleotide sequence of VGAM2323 RNA, herein designated VGAM RNA, also designated SEQ ID:5034.

[78948] Another function of VGAM2323 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM2323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. LOC127534 (Accession XM_060532) is another VGAM2323 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37164, to the nucleotide sequence of VGAM2323 RNA, herein designated VGAM RNA, also designated SEQ ID:5034.

[78949] Another function of VGAM2323 is therefore inhibition of LOC127534 (Accession XM_060532). Accordingly, utilities of VGAM2323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC155179 (Accession XM_088169) is another VGAM2323 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39554, to the nucleotide sequence of VGAM2323 RNA, herein designated VGAM RNA, also designated SEQ ID:5034.

[78950] Another function of VGAM2323 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities

of VGAM2323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2324 (VGAM2324) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78951] VGAM2324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2324 was detected is described hereinabove with reference to Figs. 1-8.

[78952] VGAM2324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78953] VGAM2324 gene encodes a VGAM2324 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2324 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2324 precursor RNA is designated SEQ ID:2310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2310 is located at position 26882 relative to the genome of Rana Tigrina Ranavirus.

[78954] VGAM2324 precursor RNA folds onto itself, forming VGAM2324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[78955] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2324 folded precursor RNA into VGAM2324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2324 RNA is designated SEQ ID:5035, and

is provided hereinbelow with reference to the sequence listing part.

[78956] VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2324 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78957] VGAM2324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2324 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78958] The complementary binding of VGAM2324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2324 host target RNA into VGAM2324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78959] It is appreciated that VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2324 host target genes. The mRNA of each one of this plurality of VGAM2324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2324 RNA, herein designated VGAM RNA, and which when bound by VGAM2324 RNA causes inhibition of translation of respective one or more VGAM2324 host target proteins.

[78960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2324 gene, herein designated VGAM GENE, on one or more VGAM2324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78961] It is yet further appreciated that a function of VGAM2324 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2324 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2324 correlate with, and may be deduced from, the identity of the host target genes which VGAM2324 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78962] Nucleotide sequences of the VGAM2324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2324 are further described hereinbelow with reference to Table 1.

[78963] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2324 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2324 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78964] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2324 gene, herein designated VGAM is inhibition of expression of VGAM2324 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2324 correlate with, and may be deduced from, the identity of the target genes which VGAM2324 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78965] FLJ20298 (Accession NM_017752) is a VGAM2324 host target gene. FLJ20298 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20298 BINDING SITE, designated SEQ ID:19363, to the nucleotide sequence of VGAM2324 RNA, herein designated VGAM RNA, also designated SEQ ID:5035.

[78966] A function of VGAM2324 is therefore inhibition of FLJ20298 (Accession NM_017752). Accordingly, utilities of VGAM2324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20298. LOC152445 (Accession XM_098231) is another VGAM2324 host target gene. LOC152445 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:41508, to the nucleotide sequence of VGAM2324 RNA, herein designated VGAM RNA, also designated SEQ ID:5035.

[78967] Another function of VGAM2324 is therefore inhibition of LOC152445 (Accession XM_098231). Accordingly, utilities of VGAM2324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2325 (VGAM2325) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78968] VGAM2325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2325 was detected is described hereinabove with reference to Figs. 1-8.

[78969] VGAM2325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78970] VGAM2325 gene encodes a VGAM2325 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2325 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2325 precursor RNA is designated SEQ ID:2311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2311 is located at position 28131 relative to the genome of Rana Tigrina Ranavirus.

[78971] VGAM2325 precursor RNA folds onto itself, forming VGAM2325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[78972] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2325 folded precursor RNA into VGAM2325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2325 RNA is designated SEQ ID:5036, and is provided hereinbelow with reference to the sequence listing part.

[78973] VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2325 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[78974] VGAM2325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2325 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2325 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[78975] The complementary binding of VGAM2325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2325 host target RNA into VGAM2325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[78976] It is appreciated that VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2325 host target genes. The mRNA of each one of this plurality of VGAM2325 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2325 RNA, herein designated VGAM RNA, and which when bound by VGAM2325 RNA causes inhibition of translation of respective one or more VGAM2325 host target proteins.

[78977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2325 gene, herein designated VGAM GENE, on one or more VGAM2325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[78978] It is yet further appreciated that a function of VGAM2325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2325 correlate with, and may be deduced from, the identity of the host target genes which VGAM2325 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[78979] Nucleotide sequences of the VGAM2325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2325 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2325 are further described hereinbelow with reference to Table 1.

[78980] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2325 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[78981] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2325 gene, herein designated VGAM is inhibition of expression of VGAM2325 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2325 correlate with, and may be deduced from, the identity of the target genes which VGAM2325 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[78982] BCLG (Accession NM_030766) is a VGAM2325 host target gene. BCLG BINDING SITE1 through BCLG BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCLG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of BCLG BINDING SITE1 through BCLG BINDING SITE3, designated SEQ ID:25050, SEQ ID:28966 and SEQ ID:28968 respectively, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78983] A function of VGAM2325 is therefore inhibition of BCLG (Accession NM_030766). Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCLG. LIM Domain Binding 2 (LDB2, Accession NM_001290) is another VGAM2325 host target gene. LDB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LDB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDB2 BINDING SITE, designated SEQ ID:6969, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78984] Another function of VGAM2325 is therefore inhibition of LIM Domain Binding 2 (LDB2, Accession NM_001290), a gene which physically interacts with the LIM domains of nuclear proteins. Accordingly, utilities of VGAM2325 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with LDB2. The function of LDB2 has been established by previous studies. Genes encoding LIM domain-binding factors were initially isolated in a screen for proteins that physically interact with the LIM domains of nuclear proteins. These proteins are capable of binding to a variety of transcription factors and are likely to function at enhancers to bring together diverse transcription factors and form higher order activation complexes or to block formation of such complexes (Jurata and Gill, 1997). The family of genes encoding LIM domain-binding factors includes 2 members isolated from the mouse, Clim1 (Bach et al., 1997) and Clim2/Lbd1/Nli (Agulnick et al., 1996; Jurata et al., 1996; Bach et al., 1997) and their homologs cloned from the frog, chicken, and fly. The fact that LIM domain-binding factors are likely to be involved in the coordination of the transcriptional activity of many diverse factors might implicate them in human phenotypes characterized by multiple affected sites. Semina et al. (1998) cloned the human genes CLIM1 and CLIM2 (OMIM Ref. No. 603451). They identified human sequences homologous to the mouse gene encoding Nli/Lbd1 in the EST database. Human sequences ho-

mologous to both Clim1 and Clim2 proteins were found. To obtain full-length cDNA clones for both genes, they screened a human craniofacial cDNA library with the corresponding human clones. The CLIM1 composite cDNA was found to be 2,351 bp long; the CLIM2 composite cDNA was found to be 1,953 bp long. The genes encode proteins of similar size, 373 and 375 amino acids, respectively. The proteins show a very high degree of identity with their homologs from other species as well as with each other. Using the Genebridge 4 radiation hybrid panel, Semina et al. (1998) mapped the CLIM1 and CLIM2 genes. CLIM1 was localized to 4p16-p15 and the map position was refined to 4p15 with a regional mapping panel for human chromosome 4. CLIM2 was localized to 10q24-q25; this region shares homology with the distal region of mouse chromosome 19, where the mouse gene Lbd1 was mapped by Yamashita et al. (1998).

[78985] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[78986] Semina, E. V.; Altherr, M. R.; Murray, J. C. : Cloning and chromosomal localization of two novel human genes encoding LIM-domain binding factors CLIM1 and

CLIM2/LDB1/NL1. Mammalian Genome 9: 921-924, 1998. ; and

[78987] Yamashita, T.; Agulnick, A. D.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Westphal, H. : Genomic structure and chromosomal localization of the mouse LIM domain-binding protein 1 g.

[78988] Further studies establishing the function and utilities of LDB2 are found in John Hopkins OMIM database record ID 603450, and in sited publications numbered 5977-5982 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Podocalyxin-like (PODXL, Accession NM_005397) is another VGAM2325 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:11872, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78989] Another function of VGAM2325 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene

which is an antiadhesin. Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.TR2 (Accession XM_051264) is another VGAM2325 host target gene. TR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TR2 BINDING SITE, designated SEQ ID:35793, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78990] Another function of VGAM2325 is therefore inhibition of TR2 (Accession XM_051264), a gene which maintains high levels of reduced glutathione in the cytosol (by similarity). Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TR2. The function of TR2 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM125.Chromosome 20 Open Reading Frame 18 (C20orf18, Accession NM_031228) is another VGAM2325 host target gene. C20orf18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf18 BINDING SITE, designated SEQ ID:25275, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78991] Another function of VGAM2325 is therefore inhibition of Chromosome 20 Open Reading Frame 18 (C20orf18, Accession NM_031228). Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf18. Dynactin 4 (p62) (DCTN4, Accession XM_041993) is another VGAM2325 host target gene. DCTN4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCTN4 BINDING SITE, designated SEQ ID:33666, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78992] Another function of VGAM2325 is therefore inhibition of Dynactin 4 (p62) (DCTN4, Accession XM_041993). Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN4. KIAA1855 (Accession XM_166453) is another VGAM2325 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44353, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78993] Another function of VGAM2325 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM2325 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1855. LOC158402 (Accession XM_098936) is another VGAM2325 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41977, to the nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78994] Another function of VGAM2325 is therefore inhibition of LOC158402 (Accession XM_098936). Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. LOC56963 (Accession XM_049372) is another VGAM2325 host target gene. LOC56963 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56963 BINDING SITE, designated SEQ ID:35400, to the

nucleotide sequence of VGAM2325 RNA, herein designated VGAM RNA, also designated SEQ ID:5036.

[78995] Another function of VGAM2325 is therefore inhibition of LOC56963 (Accession XM_049372). Accordingly, utilities of VGAM2325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56963. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2326 (VGAM2326) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[78996] VGAM2326 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2326 was detected is described hereinabove with reference to Figs. 1-8.

[78997] VGAM2326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[78998] VGAM2326 gene encodes a VGAM2326 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2326 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2326 precursor RNA is designated SEQ ID:2312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2312 is located at position 37660 relative to the genome of Rana Tigrina Ranavirus.

[78999] VGAM2326 precursor RNA folds onto itself, forming VGAM2326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79000] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2326 folded precursor RNA into VGAM2326 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2326 RNA is designated SEQ ID:5037, and is provided hereinbelow with reference to the sequence listing part.

[79001] VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2326 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79002] VGAM2326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2326 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79003] The complementary binding of VGAM2326 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2326 host target RNA into VGAM2326 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79004] It is appreciated that VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2326 host target genes. The mRNA of each one of this plurality of VGAM2326 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2326 RNA, herein designated VGAM RNA, and which when bound by VGAM2326 RNA causes inhibition of translation of respective one or more VGAM2326 host target proteins.

[79005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2326 gene, herein designated VGAM GENE, on one or more VGAM2326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79006] It is yet further appreciated that a function of VGAM2326 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2326 correlate with, and may be deduced from, the identity of the host target genes which VGAM2326 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79007] Nucleotide sequences of the VGAM2326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2326 are further described hereinbelow with reference to Table 1.

[79008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2326 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2326 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79009] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2326 gene, herein designated VGAM is inhibition of expression of VGAM2326 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2326 correlate with, and may be deduced from, the identity of the target genes which VGAM2326 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79010] B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM_138931) is a VGAM2326 host target gene. BCL6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BCL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:29057, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79011] A function of VGAM2326 is therefore inhibition of B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession

NM_138931), a gene which is involved in the generation and maintenance of both T and B cells during immune responses. Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL6. The function of BCL6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481.Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM_017454) is another VGAM2326 host target gene. STAU BINDING SITE1 through STAU BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STAU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAU BINDING SITE1 through STAU BINDING SITE4, designated SEQ ID:18925, SEQ ID:10941, SEQ ID:18913 and SEQ ID:18919 respectively, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79012] Another function of VGAM2326 is therefore inhibition of Staufen, RNA Binding Protein (Drosophila) (STAU, Acces-

sion NM_017454), a gene which may play a role in specific positioning of mrnas at given sites in the cell and in stimulating their translation at the site. Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU. The function of STAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM916.Huntingtin-associated Protein Interacting Protein (duo) (HAPIP, Accession NM_003947) is another VGAM2326 host target gene. HAPIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAPIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAPIP BINDING SITE, designated SEQ ID:10065, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79013] Another function of VGAM2326 is therefore inhibition of Huntingtin-associated Protein Interacting Protein (duo) (HAPIP, Accession NM_003947). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HAPIP. KIAA0092 (Accession NM_014679) is another VGAM2326 host target gene. KIAA0092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0092 BINDING SITE, designated SEQ ID:16151, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79014] Another function of VGAM2326 is therefore inhibition of KIAA0092 (Accession NM_014679). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0092. KIAA0217 (Accession XM_040265) is another VGAM2326 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33282, to the

nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79015] Another function of VGAM2326 is therefore inhibition of KIAA0217 (Accession XM_040265). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. LIM Domain Kinase 2 (LIMK2, Accession NM_016733) is another VGAM2326 host target gene. LIMK2 BINDING SITE1 and LIMK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK2 BINDING SITE1 and LIMK2 BINDING SITE2, designated SEQ ID:18785 and SEQ ID:12095 respectively, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79016] Another function of VGAM2326 is therefore inhibition of LIM Domain Kinase 2 (LIMK2, Accession NM_016733). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK2. LOC150225 (Accession

XM_097870) is another VGAM2326 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41185, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79017] Another function of VGAM2326 is therefore inhibition of LOC150225 (Accession XM_097870). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC158191 (Accession XM_088505) is another VGAM2326 host target gene. LOC158191 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158191 BINDING SITE, designated SEQ ID:39757, to the nucleotide sequence of VGAM2326 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5037.

[79018] Another function of VGAM2326 is therefore inhibition of LOC158191 (Accession XM_088505). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158191. LOC196446 (Accession XM_113722) is another VGAM2326 host target gene. LOC196446 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196446 BINDING SITE, designated SEQ ID:42372, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79019] Another function of VGAM2326 is therefore inhibition of LOC196446 (Accession XM_113722). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196446. LOC222182 (Accession XM_168471) is another VGAM2326 host target gene. LOC222182 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222182, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222182 BINDING SITE, designated SEQ ID:45195, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79020] Another function of VGAM2326 is therefore inhibition of LOC222182 (Accession XM_168471). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222182. LOC90841 (Accession XM_034427) is another VGAM2326 host target gene. LOC90841 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90841 BINDING SITE, designated SEQ ID:32111, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79021] Another function of VGAM2326 is therefore inhibition of LOC90841 (Accession XM_034427). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90841. LOC91056 (Accession XM_170662) is another VGAM2326 host target gene. LOC91056 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91056 BINDING SITE, designated SEQ ID:45438, to the nucleotide sequence of VGAM2326 RNA, herein designated VGAM RNA, also designated SEQ ID:5037.

[79022] Another function of VGAM2326 is therefore inhibition of LOC91056 (Accession XM_170662). Accordingly, utilities of VGAM2326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91056. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2327 (VGAM2327) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79023] VGAM2327 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2327 was detected is described hereinabove with reference to Figs. 1-8.

[79024] VGAM2327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79025] VGAM2327 gene encodes a VGAM2327 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2327 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2327 precursor RNA is designated SEQ ID:2313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2313 is located at position 30986 relative to the genome of Rana Tigrina Ranavirus.

[79026] VGAM2327 precursor RNA folds onto itself, forming VGAM2327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79027] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2327 folded precursor RNA into VGAM2327 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM2327 RNA is designated SEQ ID:5038, and is provided hereinbelow with reference to the sequence listing part.

[79028] VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2327 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79029] VGAM2327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2327 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2327 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79030] The complementary binding of VGAM2327 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2327 host target RNA into VGAM2327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79031] It is appreciated that VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2327 host target genes. The mRNA of each one of this plurality of VGAM2327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2327 RNA, herein designated VGAM RNA, and which when bound by VGAM2327 RNA causes inhibition of translation of respective one or more VGAM2327 host target proteins.

[79032] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2327 gene, herein designated VGAM GENE, on one or more VGAM2327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79033] It is yet further appreciated that a function of VGAM2327 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2327 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2327 correlate with, and may be deduced from, the identity of the host target genes which VGAM2327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79034] Nucleotide sequences of the VGAM2327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2327 are further described hereinbelow with reference to Table 1.

[79035] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2327 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79036] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2327 gene, herein designated VGAM is inhibition of expression of VGAM2327 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2327 correlate with, and may be deduced from, the identity of the target genes which VGAM2327 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79037] G Protein-coupled Receptor 61 (GPR61, Accession XM_086232) is a VGAM2327 host target gene. GPR61 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by GPR61, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR61 BINDING SITE, designated SEQ ID:38562, to the nucleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, also designated SEQ ID:5038.

[79038] A function of VGAM2327 is therefore inhibition of G Protein-coupled Receptor 61 (GPR61, Accession XM_086232), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of VGAM2327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR61. The function of GPR61 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.Phospholipid Scramblase 1 (PLSCR1, Accession NM_021105) is another VGAM2327 host target gene. PLSCR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLSCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PLSCR1 BINDING SITE, designated SEQ ID:22085, to the nucleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, also designated SEQ ID:5038.

[79039] Another function of VGAM2327 is therefore inhibition of Phospholipid Scramblase 1 (PLSCR1, Accession NM_021105), a gene which involves in the initiation of fibrin clot formation and in the recognition of apoptotic and injured cells by the reticuloendothelial system. Accordingly, utilities of VGAM2327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR1. The function of PLSCR1 has been established by previous studies. Quantitative immunoblotting revealed that PL scramblase levels are approximately 10-fold higher in platelets than in erythrocytes, which Zhou et al. (1997) stated was consistent with the apparent increased enzyme activity of the platelet plasma membrane. Using Northern blot analysis, the authors demonstrated that PL scramblase was expressed as 1.6- and 2.6-kb mRNAs in all tissues and cell lines tested. Independently, Kasukabe et al. (1998) identified PL scramblase as the human homolog of mouse MmTRA1b (Mm1 cell-derived transplantability-associated gene 1b), the

gene encoding a truncated leukemogenesis-associated cDNA, MmTRA1a. Human and mouse MmTRA1b are 78% identical. Sequence analysis revealed that the predicted human protein contains 3 leucine repeats and a proline-rich N-terminal domain with 3 motifs which may act as docking sites for SH3 motifs. Kasukabe et al. (1998) noted that mouse MmTRA1b was distinct from a putative mouse PL scramblase homolog identified by Zhou et al. (1998). The mouse protein described by Zhou et al. (1998) shares 75% and 71% identity with mouse MmTRA1b and human PL scramblase, respectively

[79040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[79041] Kasukabe, T.; Kobayashi, H.; Kaneko, Y.; Okabe-Kado, J.; Honma, Y. : Identity of human normal counterpart (MmTRA1b) of mouse leukemogenesis-associated gene (MmTRA1a) product as a plasma membrane phospholipid scramblase and chromosome mapping of the human Mm-TRA1b/phospholipid scramblase gene. Biochem. Biophys. Res. Commun. 249: 449-455, 1998. ; and

[79042] Zhou, Q.; Zhao, J.; Stout, J. G.; Luhm, R. A.; Wiedmer, T.; Sims, P. J. : Molecular cloning of human plasma membrane

phospholipid scramblase: a protein mediating transbilayer movement of pl.

[79043] Further studies establishing the function and utilities of PLSCR1 are found in John Hopkins OMIM database record ID 604170, and in sited publications numbered 8704-5061 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630) is another VGAM2327 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:12154, to the nucleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, also designated SEQ ID:5038.

[79044] Another function of VGAM2327 is therefore inhibition of Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630), a gene which is a Prostaglandin transporter. Accordingly, utilities of VGAM2327 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with SLC21A2. The function of SLC21A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83.FLJ10702 (Accession NM_018184) is another VGAM2327 host target gene. FLJ10702 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10702 BINDING SITE, designated SEQ ID:20024, to the nucleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, also designated SEQ ID:5038.

[79045] Another function of VGAM2327 is therefore inhibition of FLJ10702 (Accession NM_018184). Accordingly, utilities of VGAM2327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10702. FLJ12287 (Accession NM_022367) is another VGAM2327 host target gene. FLJ12287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12287, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12287 BINDING SITE, designated SEQ ID:22753, to the nucleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, also designated SEQ ID:5038.

[79046] Another function of VGAM2327 is therefore inhibition of FLJ12287 (Accession NM_022367). Accordingly, utilities of VGAM2327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12287. MGC20253 (Accession NM_144583) is another VGAM2327 host target gene. MGC20253 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20253 BINDING SITE, designated SEQ ID:29396, to the nucleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, also designated SEQ ID:5038.

[79047] Another function of VGAM2327 is therefore inhibition of MGC20253 (Accession NM_144583). Accordingly, utilities of VGAM2327 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC20253. PR Domain Containing 10 (PRDM10, Accession NM_020228) is another VGAM2327 host target gene. PRDM10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM10 BINDING SITE, designated SEQ ID:21495, to the nucleotide sequence of VGAM2327 RNA, herein designated VGAM RNA, also designated SEQ ID:5038.

[79048] Another function of VGAM2327 is therefore inhibition of PR Domain Containing 10 (PRDM10, Accession NM_020228). Accordingly, utilities of VGAM2327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM10. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2328 (VGAM2328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79049] VGAM2328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2328 was detected is described hereinabove with reference to Figs. 1-8.

[79050] VGAM2328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM2328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79051] VGAM2328 gene encodes a VGAM2328 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2328 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2328 precursor RNA is designated SEQ ID:2314, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2314 is located at position 16752 relative to the genome of Rana Tigrina Ranavirus.

[79052] VGAM2328 precursor RNA folds onto itself, forming VGAM2328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79053] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2328 folded precursor RNA into VGAM2328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2328 RNA is designated SEQ ID:5039, and is provided hereinbelow with reference to the sequence listing part.

[79054] VGAM2328 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2328 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[79055] VGAM2328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2328 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2328 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79056] The complementary binding of VGAM2328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2328 host target RNA into VGAM2328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79057] It is appreciated that VGAM2328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2328 host target genes. The mRNA of each one of this plurality of VGAM2328 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2328 RNA, herein designated VGAM RNA, and which when bound by VGAM2328 RNA causes inhibition of translation of respective one or more VGAM2328 host target proteins.

[79058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2328 gene, herein designated VGAM GENE, on one or more VGAM2328 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79059] It is yet further appreciated that a function of VGAM2328 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM2328 correlate with, and may be deduced from, the identity of the host target genes which VGAM2328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79060] Nucleotide sequences of the VGAM2328 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2328 are further described hereinbelow with reference to Table 1.

[79061] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2328 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79062] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2328 gene, herein designated VGAM is inhibition of expression of VGAM2328 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2328 correlate with, and may be deduced from, the identity of the target genes which VGAM2328 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79063] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession NM_144767) is a VGAM2328 host target gene. AKAP13

BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:29559, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79064] A function of VGAM2328 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession NM_144767), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17.Distal-less Homeobox 4 (DLX4, Accession NM_138281) is another VGAM2328 host target gene. DLX4 BINDING SITE1 and DLX4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II

or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLX4 BINDING SITE1 and DLX4 BINDING SITE2, designated SEQ ID:28694 and SEQ ID:7646 respectively, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79065] Another function of VGAM2328 is therefore inhibition of Distal-less Homeobox 4 (DLX4, Accession NM_138281), a gene which may regulate gene expression, morphogenesis, and differentiation. Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLX4. The function of DLX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM_020149) is another VGAM2328 host target gene. MEIS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEIS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MEIS2 BINDING SITE, designated SEQ ID:21349, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79066] Another function of VGAM2328 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM_020149), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS2. The function of MEIS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1244.Norrie Disease (pseudoglioma) (NDP, Accession NM_000266) is another VGAM2328 host target gene. NDP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP BINDING SITE, designated SEQ ID:5810, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79067] Another function of VGAM2328 is therefore inhibition of Norrie Disease (pseudoglioma) (NDP, Accession NM_000266), a gene which may be involved in a pathway that regulates neural cell differentiation and proliferation. Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP. The function of NDP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113.Nuclear Factor Related to Kappa B Binding Protein (NFRKB, Accession NM_006165) is another VGAM2328 host target gene. NFRKB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFRKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFRKB BINDING SITE, designated SEQ ID:12824, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79068] Another function of VGAM2328 is therefore inhibition of Nuclear Factor Related to Kappa B Binding Protein (NFRKB,

Accession NM_006165). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFRKB. UC28 (Accession NM_021635) is another VGAM2328 host target gene. UC28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UC28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UC28 BINDING SITE, designated SEQ ID:22282, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79069] Another function of VGAM2328 is therefore inhibition of UC28 (Accession NM_021635). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UC28. C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM_031911) is another VGAM2328 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE, designated SEQ ID:25668, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79070] Another function of VGAM2328 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM_031911). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7. KIAA1416 (Accession XM_098762) is another VGAM2328 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41805, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79071] Another function of VGAM2328 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1416. KIAA1493 (Accession XM_034415) is another VGAM2328 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32096, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79072] Another function of VGAM2328 is therefore inhibition of KIAA1493 (Accession XM_034415). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. KIAA1524 (Accession XM_056015) is another VGAM2328 host target gene. KIAA1524 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1524 BINDING SITE, designated SEQ ID:36361, to the

nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79073] Another function of VGAM2328 is therefore inhibition of KIAA1524 (Accession XM_056015). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1524. KIAA1904 (Accession XM_056282) is another VGAM2328 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36384, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79074] Another function of VGAM2328 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. TUSP (Accession NM_020245) is another VGAM2328 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21538, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79075] Another function of VGAM2328 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC128989 (Accession XM_059310) is another VGAM2328 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36942, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79076] Another function of VGAM2328 is therefore inhibition of LOC128989 (Accession XM_059310). Accordingly, utilities

of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC146455 (Accession XM_085471) is another VGAM2328 host target gene. LOC146455 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:38157, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79077] Another function of VGAM2328 is therefore inhibition of LOC146455 (Accession XM_085471). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455. LOC150282 (Accession XM_086852) is another VGAM2328 host target gene. LOC150282 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150282 BINDING SITE, designated SEQ ID:38919, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79078] Another function of VGAM2328 is therefore inhibition of LOC150282 (Accession XM_086852). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150282. LOC219731 (Accession XM_167596) is another VGAM2328 host target gene. LOC219731 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:44719, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79079] Another function of VGAM2328 is therefore inhibition of LOC219731 (Accession XM_167596). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219731. LOC254024 (Accession XM_171285) is another VGAM2328 host target gene. LOC254024 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254024 BINDING SITE, designated SEQ ID:46040, to the nucleotide sequence of VGAM2328 RNA, herein designated VGAM RNA, also designated SEQ ID:5039.

[79080] Another function of VGAM2328 is therefore inhibition of LOC254024 (Accession XM_171285). Accordingly, utilities of VGAM2328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254024. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2329 (VGAM2329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79081] VGAM2329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2329 was detected is described hereinabove with reference to Figs. 1-8.

[79082] VGAM2329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79083] VGAM2329 gene encodes a VGAM2329 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2329 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2329 precursor RNA is designated SEQ ID:2315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2315 is located at position 39739 relative to the genome of Equine Herpesvirus 2.

[79084] VGAM2329 precursor RNA folds onto itself, forming VGAM2329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[79085] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2329 folded precursor RNA into VGAM2329 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2329 RNA is designated SEQ ID:5040, and is provided hereinbelow with reference to the sequence listing part.

[79086] VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2329 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79087] VGAM2329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2329 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2329 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2329 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79088] The complementary binding of VGAM2329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2329 host target RNA into VGAM2329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79089] It is appreciated that VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2329 host target genes. The mRNA of each one of this plurality of VGAM2329 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2329 RNA, herein designated VGAM RNA, and which when bound by VGAM2329 RNA causes inhibition of translation of respective one or more VGAM2329 host target proteins.

[79090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2329 gene, herein designated VGAM GENE, on one or more VGAM2329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79091] It is yet further appreciated that a function of VGAM2329 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2329 correlate with, and may be deduced from, the identity of the host target genes which VGAM2329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79092] Nucleotide sequences of the VGAM2329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2329 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2329 are further described hereinbelow with reference to Table 1.

[79093] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2329 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79094] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2329 gene, herein designated VGAM is inhibition of expression of VGAM2329 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2329 correlate with, and may be deduced from, the identity of the target genes which VGAM2329 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79095] APM1 (Accession NM_004797) is a VGAM2329 host target gene. APM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of APM1 BINDING SITE, designated SEQ ID:11205, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79096] A function of VGAM2329 is therefore inhibition of APM1 (Accession NM_004797). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1. UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 3 (B4GALT3, Accession NM_003779) is another VGAM2329 host target gene. B4GALT3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by B4GALT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT3 BINDING SITE, designated SEQ ID:9863, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79097] Another function of VGAM2329 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 3 (B4GALT3, Accession NM_003779). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with B4GALT3. Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM_013372) is another VGAM2329 host target gene. CKTSF1B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CKTSF1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKTSF1B1 BINDING SITE, designated SEQ ID:15020, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79098] Another function of VGAM2329 is therefore inhibition of Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM_013372), a gene which blocks signaling of bone morphogenetic protein (BMP) . Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKTSF1B1. The function of CKTSF1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28.Potassium Inwardly-rectifying Channel, Subfamily J, Member 3 (KCNJ3, Accession NM_002239) is another VGAM2329 host target gene.

KCNJ3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNJ3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ3 BINDING SITE, designated SEQ ID:8021, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79099] Another function of VGAM2329 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 3 (KCNJ3, Accession NM_002239), a gene which is a potassium inwardly-rectifying channel. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ3. The function of KCNJ3 has been established by previous studies. Inwardly rectifying potassium channels control the excitability of neuronal cells by allowing potassium ion influx through a nonvoltage-gated mechanism. See 602208. Stoffel et al. (1994) screened a rat insulinoma cell line cDNA library with a human IRK1 (OMIM Ref. No. 600681) probe. A cDNA, designated RINm5F by them, was shown to be highly expressed in atrial myocardium and brain. The same sequence was reported by

Kubo et al. (1993) and was designated GIRK1. It was shown to be a G protein-coupled muscarinic potassium channel related to ROMK1 (OMIM Ref. No. 600359) and IRK1. Stoffel et al. (1994) isolated and partially characterized the human GIRK1 gene which was assigned to chromosome 2 using a somatic cell hybrid DNA panel and localized it to 2q24.1 by fluorescence in situ hybridization. A polymorphic dinucleotide repeat sequence was found in the GIRK1 genomic clones and used to map the locus genetically. Schoots et al. (1996) cloned the complete human GIRK1 gene by probing a cerebellum cDNA library with the rat gene. The cDNA encodes a predicted 501-amino acid protein whose sequence is 99% identical to that of rat GIRK1. Northern blot analysis showed that human GIRK1 is expressed as 2 mRNAs (4.3 kb and 6.2 kb) that are most abundant in brain, but are also seen in kidney and heart. In Xenopus oocytes that coexpressed GIRK1 and the rat serotonin receptor 5-HT-1A (OMIM Ref. No. 109760), serotonin evoked inward potassium currents. Schoots et al. (1997) found that the KCNJ3 gene, which they referred to as Kir3.1, contains 3 exons and spans more than 45 kb

[79100] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[79101] Kubo, Y.; Reuveny, E.; Slesinger, P. A.; Jan, Y. N.; Jan, L. Y. : Primary structure and functional expression of a rat G-protein-coupled muscarinic potassium channel. Nature 364: 802-806, 1993. ; and

[79102] Schoots, O.; Voskoglou, T.; Van Tol, H. H. M. : Genomic organization and promoter analysis of the human G-protein-coupled K+ channel Kir3.1 (KCNJ3/HGIRK1). Genomics 39: 279-288, 1997.

[79103] Further studies establishing the function and utilities of KCNJ3 are found in John Hopkins OMIM database record ID 601534, and in sited publications numbered 7203-7206 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007289) is another VGAM2329 host target gene. MME BINDING SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE1

through MME BINDING SITE4, designated SEQ ID:14157, SEQ ID:14153, SEQ ID:14149 and SEQ ID:6601 respectively, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79104] Another function of VGAM2329 is therefore inhibition of Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007289), a gene which is thermolysin-like specificity. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MME. The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1332.RAN Binding Protein 2 (RANBP2, Accession NM_006267) is another VGAM2329 host target gene. RANBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RANBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP2 BINDING SITE, designated SEQ ID:12947, to the nucleotide

sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79105] Another function of VGAM2329 is therefore inhibition of RAN Binding Protein 2 (RANBP2, Accession NM_006267), a gene which is thought to control a variety of cellular functions through its interactions with other proteins. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP2. The function of RANBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1337.Ribosomal Protein L10 (RPL10, Accession NM_006013) is another VGAM2329 host target gene. RPL10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL10 BINDING SITE, designated SEQ ID:12621, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79106] Another function of VGAM2329 is therefore inhibition of

Ribosomal Protein L10 (RPL10, Accession NM_006013), a gene which may be a component of the 60S ribosomal subunit. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL10. The function of RPL10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476.T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189) is another VGAM2329 host target gene. TAL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:9167, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79107] Another function of VGAM2329 is therefore inhibition of T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM_003189), a gene which may help control cell growth and differentiation. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with TAL1. The function of TAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.Tumor Necrosis Factor Receptor Superfamily, Member 1B (TNFRSF1B, Accession NM_001066) is another VGAM2329 host target gene. TNFRSF1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF1B BINDING SITE, designated SEQ ID:6733, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79108] Another function of VGAM2329 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 1B (TNFRSF1B, Accession NM_001066), a gene which mediates proinflammatory cellular responses. Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF1B. The function of TNFRSF1B and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM939.Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966) is another VGAM2329 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27525, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79109] Another function of VGAM2329 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. DKFZP564O123 (Accession XM_002810) is another VGAM2329 host target gene. DKFZP564O123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZP564O123 BINDING SITE, designated SEQ ID:29904, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79110] Another function of VGAM2329 is therefore inhibition of DKFZP564O123 (Accession XM_002810). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O123. KIAA1560 (Accession XM_034422) is another VGAM2329 host target gene. KIAA1560 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32097, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79111] Another function of VGAM2329 is therefore inhibition of KIAA1560 (Accession XM_034422). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1560. MGC3222 (Accession NM_024334) is another VGAM2329 host target gene. MGC3222 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3222 BINDING SITE, designated SEQ ID:23640, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79112] Another function of VGAM2329 is therefore inhibition of MGC3222 (Accession NM_024334). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3222. Peroxisomal Membrane Protein 4, 24kDa (PXMP4, Accession NM_007238) is another VGAM2329 host target gene. PXMP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PXMP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXMP4 BINDING SITE, designated SEQ ID:14110, to the nucleotide sequence of

VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79113] Another function of VGAM2329 is therefore inhibition of Peroxisomal Membrane Protein 4, 24kDa (PXMP4, Accession NM_007238). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXMP4. Rab11-FIP2 (Accession NM_014904) is another VGAM2329 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17093, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79114] Another function of VGAM2329 is therefore inhibition of Rab11-FIP2 (Accession NM_014904). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. Rabip4R (Accession NM_017987) is another VGAM2329 host target gene. Rabip4R BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Rabip4R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rabip4R BINDING SITE, designated SEQ ID:19714, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79115] Another function of VGAM2329 is therefore inhibition of Rabip4R (Accession NM_017987). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rabip4R. Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144) is another VGAM2329 host target gene. RHOBTB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB1 BINDING SITE, designated SEQ ID:43948, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79116] Another function of VGAM2329 is therefore inhibition of Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB1. Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671) is another VGAM2329 host target gene. SLC1A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC1A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A7 BINDING SITE, designated SEQ ID:13487, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79117] Another function of VGAM2329 is therefore inhibition of Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A7. SMT3 Suppressor of Mif Two 3 Homolog 2 (yeast) (SMT3H2, Accession NM_006937) is another VGAM2329

host target gene. SMT3H2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMT3H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H2 BINDING SITE, designated SEQ ID:13818, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79118] Another function of VGAM2329 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 2 (yeast) (SMT3H2, Accession NM_006937). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H2. LOC112687 (Accession XM_053145) is another VGAM2329 host target gene. LOC112687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112687 BINDING SITE, designated SEQ ID:36063, to the nucleotide sequence of VGAM2329 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5040.

[79119] Another function of VGAM2329 is therefore inhibition of LOC112687 (Accession XM_053145). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112687. LOC143154 (Accession XM_084441) is another VGAM2329 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37583, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79120] Another function of VGAM2329 is therefore inhibition of LOC143154 (Accession XM_084441). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143154. LOC144262 (Accession XM_084793) is another VGAM2329 host target gene. LOC144262 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144262, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144262 BINDING SITE, designated SEQ ID:37703, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79121] Another function of VGAM2329 is therefore inhibition of LOC144262 (Accession XM_084793). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144262. LOC151632 (Accession XM_098098) is another VGAM2329 host target gene. LOC151632 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151632 BINDING SITE, designated SEQ ID:41380, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79122] Another function of VGAM2329 is therefore inhibition of LOC151632 (Accession XM_098098). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151632. LOC152271 (Accession XM_087419) is another VGAM2329 host target gene. LOC152271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152271 BINDING SITE, designated SEQ ID:39237, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79123] Another function of VGAM2329 is therefore inhibition of LOC152271 (Accession XM_087419). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152271. LOC158434 (Accession XM_098939) is another VGAM2329 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41980, to

the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79124] Another function of VGAM2329 is therefore inhibition of LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC158662 (Accession XM_088633) is another VGAM2329 host target gene. LOC158662 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158662 BINDING SITE, designated SEQ ID:39879, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79125] Another function of VGAM2329 is therefore inhibition of LOC158662 (Accession XM_088633). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158662. LOC200904 (Accession XM_117291) is another VGAM2329 host target gene. LOC200904 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC200904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200904 BINDING SITE, designated SEQ ID:43359, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79126] Another function of VGAM2329 is therefore inhibition of LOC200904 (Accession XM_117291). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200904. LOC201824 (Accession XM_114384) is another VGAM2329 host target gene. LOC201824 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201824 BINDING SITE, designated SEQ ID:42919, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79127] Another function of VGAM2329 is therefore inhibition of LOC201824 (Accession XM_114384). Accordingly, utilities

of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201824. LOC203083 (Accession XM_117496) is another VGAM2329 host target gene. LOC203083 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203083 BINDING SITE, designated SEQ ID:43476, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79128] Another function of VGAM2329 is therefore inhibition of LOC203083 (Accession XM_117496). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203083. LOC219294 (Accession XM_167566) is another VGAM2329 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC219294 BINDING SITE, designated SEQ ID:44684, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79129] Another function of VGAM2329 is therefore inhibition of LOC219294 (Accession XM_167566). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. LOC219300 (Accession XM_168749) is another VGAM2329 host target gene. LOC219300 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219300 BINDING SITE, designated SEQ ID:45287, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79130] Another function of VGAM2329 is therefore inhibition of LOC219300 (Accession XM_168749). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219300. LOC219919 (Accession XM_167785) is another VGAM2329 host target gene. LOC219919 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219919 BINDING SITE, designated SEQ ID:44798, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79131] Another function of VGAM2329 is therefore inhibition of LOC219919 (Accession XM_167785). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219919. LOC254176 (Accession XM_173215) is another VGAM2329 host target gene. LOC254176 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254176 BINDING SITE, designated SEQ ID:46473, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79132] Another function of VGAM2329 is therefore inhibition of

LOC254176 (Accession XM_173215). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254176. LOC255327 (Accession XM_171236) is another VGAM2329 host target gene. LOC255327 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255327 BINDING SITE, designated SEQ ID:46021, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79133] Another function of VGAM2329 is therefore inhibition of LOC255327 (Accession XM_171236). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255327. LOC256594 (Accession XM_173127) is another VGAM2329 host target gene. LOC256594 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC256594 BINDING SITE, designated SEQ ID:46376, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79134] Another function of VGAM2329 is therefore inhibition of LOC256594 (Accession XM_173127). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256594. LOC51301 (Accession NM_016591) is another VGAM2329 host target gene. LOC51301 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18668, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79135] Another function of VGAM2329 is therefore inhibition of LOC51301 (Accession NM_016591). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. LOC90826 (Accession XM_034321) is another

VGAM2329 host target gene. LOC90826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90826 BINDING SITE, designated SEQ ID:32047, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79136] Another function of VGAM2329 is therefore inhibition of LOC90826 (Accession XM_034321). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90826. LOC93206 (Accession XM_049838) is another VGAM2329 host target gene. LOC93206 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93206 BINDING SITE, designated SEQ ID:35514, to the nucleotide sequence of VGAM2329 RNA, herein designated VGAM RNA, also designated SEQ ID:5040.

[79137] Another function of VGAM2329 is therefore inhibition of LOC93206 (Accession XM_049838). Accordingly, utilities of VGAM2329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2330 (VGAM2330) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79138] VGAM2330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2330 was detected is described hereinabove with reference to Figs. 1-8.

[79139] VGAM2330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2330 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79140] VGAM2330 gene encodes a VGAM2330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2330 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2330 precursor RNA is designated SEQ ID:2316, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2316 is located at position 1147 relative to the genome of Equine Herpesvirus 2.

[79141] VGAM2330 precursor RNA folds onto itself, forming VGAM2330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79142] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2330 folded precursor RNA into VGAM2330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2330 RNA is designated SEQ ID:5041, and is provided hereinbelow with reference to the sequence listing part.

[79143] VGAM2330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2330 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79144] VGAM2330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2330 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79145] The complementary binding of VGAM2330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2330 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2330 host target RNA into VGAM2330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79146] It is appreciated that VGAM2330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2330 host target genes. The mRNA of each one of this plurality of VGAM2330 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2330 RNA, herein designated VGAM RNA, and which when bound by VGAM2330 RNA causes inhibition of translation of respective one or more VGAM2330 host target proteins.

[79147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2330 gene, herein designated VGAM GENE, on one or more VGAM2330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79148] It is yet further appreciated that a function of VGAM2330 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2330 correlate with, and may be deduced from, the identity of the host target genes which VGAM2330 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79149] Nucleotide sequences of the VGAM2330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2330 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2330 are further described hereinbelow with reference to Table 1.

[79150] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2330 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2330 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[79151] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2330 gene, herein designated VGAM is inhibition of expression of VGAM2330 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2330 correlate with, and may be deduced from, the identity of the target genes which VGAM2330 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79152] AF5Q31 (Accession NM_014423) is a VGAM2330 host target gene. AF5Q31 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AF5Q31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF5Q31 BINDING SITE, designated SEQ ID:15778, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79153] A function of VGAM2330 is therefore inhibition of AF5Q31 (Accession NM_014423). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

AF5Q31. Centromere Protein B, 80kDa (CENPB, Accession XM_045451) is another VGAM2330 host target gene. CENPB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CENPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENPB BINDING SITE, designated SEQ ID:34465, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79154] Another function of VGAM2330 is therefore inhibition of Centromere Protein B, 80kDa (CENPB, Accession XM_045451), a gene which is the major centromere antigen . Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPB. The function of CENPB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM_004078) is another VGAM2330 host target gene. CSRP1 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by CSRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSRP1 BINDING SITE, designated SEQ ID:10279, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79155] Another function of VGAM2330 is therefore inhibition of Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM_004078), a gene which could play a role in neuronal development. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP1. The function of CSRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM743.EphA8 (EPHA8, Accession NM_020526) is another VGAM2330 host target gene. EPHA8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA8 BIND-

ING SITE, designated SEQ ID:21750, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79156] Another function of VGAM2330 is therefore inhibition of EphA8 (EPHA8, Accession NM_020526), a gene which Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8. The function of EPHA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494.Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817) is another VGAM2330 host target gene. GAD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAD1 BINDING SITE, designated SEQ ID:6480, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79157] Another function of VGAM2330 is therefore inhibition of

Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817), a gene which catalyzes the conversion of glutamic acid to gamma-aminobutyric acid. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAD1. The function of GAD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM691.Homeo Box C9 (HOXC9, Accession XM_028620) is another VGAM2330 host target gene. HOXC9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXC9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC9 BINDING SITE, designated SEQ ID:30719, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79158] Another function of VGAM2330 is therefore inhibition of Homeo Box C9 (HOXC9, Accession XM_028620). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with HOXC9. Kangai 1 (suppression of tumorigenicity 6, prostate; CD82 antigen (R2 leukocyte antigen, antigen detected by monoclonal and antibody IA4)) (KAI1, Accession NM_002231) is another VGAM2330 host target gene. KAI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KAI1 BINDING SITE, designated SEQ ID:8012, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79159] Another function of VGAM2330 is therefore inhibition of Kangai 1 (suppression of tumorigenicity 6, prostate; CD82 antigen (R2 leukocyte antigen, antigen detected by monoclonal and antibody IA4)) (KAI1, Accession NM_002231), a gene which associates with cd4 or cd8 and delivers costimulatory signals for the tcr/cd3 pathway. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAI1. The function of KAI1 has been established by previous studies. As noted, KAI1 is capable of inhibiting the metastatic process in experimental animals. The ex-

pression of the KAI1 gene is also downregulated during tumor progression of prostate, breast, lung, bladder, and pancreatic cancers in humans, and this downregulation appears to be at the level of transcription or posttranscription. Mashimo et al. (1998) found that the tumor suppressor gene p53 (TP53; 191170) can directly activate the KAI1 gene by interacting with the 5-prime upstream region. The p53 responding region is located approximately 860 bases upstream of the transcriptional initiation site, and contains a typical tandem repeat of the p53 consensus binding sequence. Mutations of this sequence abolish the responsiveness to p53 and also the ability to bind to p53 protein. Immunohistochemical analysis of 177 samples of human prostate tumors showed that the expression of the KAI1 gene correlated strongly with that of the p53 gene and that the loss of these 2 markers resulted in poor survival of patients. The data indicated a direct relationship between p53 and KAI1 genes and suggested that the loss of p53 function, which is commonly observed in many types of cancer, leads to downregulation of the KAI1 gene, which may result in progression of metastases Baek et al. (2002) demonstrated that interleukin-1-beta (IL1B; 147720) causes nuclear export of a

specific NCOR (OMIM Ref. No. 600849) corepressor complex, resulting in derepression of a specific subset of nuclear factor-kappa-B (NFKB; OMIM Ref. No. 164011)-regulated genes. These genes are exemplified by the tetraspanin KAI1, which regulates membrane receptor function. Nuclear export of the NCOR/TAB2 (OMIM Ref. No. 605101)/HDAC3 (OMIM Ref. No. 605166) complex by IL1B is temporally linked to selective recruitment of a TIP60 (OMIM Ref. No. 601409) coactivator complex. KAI1 is also directly activated by a ternary complex, dependent on the acetyltransferase activity of TIP60, that consists of the presenilin-dependent C-terminal cleavage product of the beta amyloid precursor protein (APP; 104760), FE65 (OMIM Ref. No. 602709), and TIP60, identifying a specific in vivo gene target of an APP-dependent transcription complex in the brain

[79160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[79161] Mashimo, T.; Watabe, M.; Hirota, S.; Hosobe, S.; Miura, K.; Tegtmeyer, P. J.; Rinker-Shaeffer, C. W.; Watabe, K. : The expression of the KAI1 gene, a tumor metastasis suppressor, is directly activated by p53. Proc. Nat. Acad. Sci. 95:

11307-11311, 1998. ; and

[79162] Baek, S. H.; Ohgi, K. A.; Rose, D. W.; Koo, E. H.; Glass, C. K.; Rosenfeld, M. G. : Exchange of N-CoR corepressor and Tip60 coactivator complexes links gene expression by NF-kappa-B and.

[79163] Further studies establishing the function and utilities of KAI1 are found in John Hopkins OMIM database record ID 600623, and in sited publications numbered 481, 6562-6564, 1635-1636, 6565-656 and 5081 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Paired Box Gene 2 (PAX2, Accession NM_003987) is another VGAM2330 host target gene. PAX2 BINDING SITE1 and PAX2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE1 and PAX2 BINDING SITE2, designated SEQ ID:10139 and SEQ ID:10145 respectively, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79164] Another function of VGAM2330 is therefore inhibition of

Paired Box Gene 2 (PAX2, Accession NM_003987), a gene which involves in kidney cell differentiation. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX2. The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM407.PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_033019) is another VGAM2330 host target gene. PCTK1 BINDING SITE1 through PCTK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCTK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK1 BINDING SITE1 through PCTK1 BINDING SITE3, designated SEQ ID:26914, SEQ ID:12873 and SEQ ID:12875 respectively, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79165] Another function of VGAM2330 is therefore inhibition of PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_033019), a gene which may play a role in signal transduction cas-

cades in terminally differentiated cells. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTK1. The function of PCTK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75.Profilin 2 (PFN2, Accession NM_002628) is another VGAM2330 host target gene. PFN2 BINDING SITE1 and PFN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PFN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFN2 BINDING SITE1 and PFN2 BINDING SITE2, designated SEQ ID:8489 and SEQ ID:12745 respectively, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79166] Another function of VGAM2330 is therefore inhibition of Profilin 2 (PFN2, Accession NM_002628). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFN2. Serine (or cysteine) Proteinase Inhibitor, Clade

B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM2330 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10363, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79167] Another function of VGAM2330 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession

NM_003036) is another VGAM2330 host target gene. SKI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKI BINDING SITE, designated SEQ ID:8989, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79168] Another function of VGAM2330 is therefore inhibition of V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM_003036). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKI. Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_000116) is another VGAM2330 host target gene. TAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAZ BINDING SITE, designated SEQ ID:5588, to the nu-

cleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79169] Another function of VGAM2330 is therefore inhibition of Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_000116). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAZ. Translocase of Inner Mitochondrial Membrane 23 Homolog (yeast) (TIMM23, Accession XM_011891) is another VGAM2330 host target gene. TIMM23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIMM23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM23 BINDING SITE, designated SEQ ID:30197, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79170] Another function of VGAM2330 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 23 Homolog (yeast) (TIMM23, Accession XM_011891), a gene which translocates nuclear-encoded proteins into the mi-

tochondrion. Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM23. The function of TIMM23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.Chromosome 4 Open Reading Frame 6 (C4orf6, Accession NM_005750) is another VGAM2330 host target gene. C4orf6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C4orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C4orf6 BINDING SITE, designated SEQ ID:12311, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79171] Another function of VGAM2330 is therefore inhibition of Chromosome 4 Open Reading Frame 6 (C4orf6, Accession NM_005750). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4orf6. DKFZP434K1772 (Accession XM_041936) is another VGAM2330 host target

gene. DKFZP434K1772 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434K1772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1772 BINDING SITE, designated SEQ ID:33633, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79172] Another function of VGAM2330 is therefore inhibition of DKFZP434K1772 (Accession XM_041936). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K1772. DKFZP564D172 (Accession NM_032042) is another VGAM2330 host target gene. DKFZP564D172 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D172 BINDING SITE, designated SEQ ID:25750, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5041.

[79173] Another function of VGAM2330 is therefore inhibition of DKFZP564D172 (Accession NM_032042). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D172. E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421) is another VGAM2330 host target gene. ELF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF4 BINDING SITE, designated SEQ ID:7122, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79174] Another function of VGAM2330 is therefore inhibition of E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF4. FLJ10206 (Accession NM_018025) is another VGAM2330 host target gene. FLJ10206 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by FLJ10206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10206 BINDING SITE, designated SEQ ID:19767, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79175] Another function of VGAM2330 is therefore inhibition of FLJ10206 (Accession NM_018025). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10206. FLJ13710 (Accession NM_024817) is another VGAM2330 host target gene. FLJ13710 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:24205, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79176] Another function of VGAM2330 is therefore inhibition of

FLJ13710 (Accession NM_024817). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13710. KIAA0022 (Accession NM_014880) is another VGAM2330 host target gene. KIAA0022 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0022 BINDING SITE, designated SEQ ID:17027, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79177] Another function of VGAM2330 is therefore inhibition of KIAA0022 (Accession NM_014880). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0022. KIAA0173 (Accession NM_014640) is another VGAM2330 host target gene. KIAA0173 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0173 BINDING SITE, designated SEQ ID:16039, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79178] Another function of VGAM2330 is therefore inhibition of KIAA0173 (Accession NM_014640). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0173. KIAA0515 (Accession XM_033380) is another VGAM2330 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31922, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79179] Another function of VGAM2330 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA0774 (Accession XM_166270) is another

VGAM2330 host target gene. KIAA0774 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0774 BINDING SITE, designated SEQ ID:44090, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79180] Another function of VGAM2330 is therefore inhibition of KIAA0774 (Accession XM_166270). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0774. KIAA0819 (Accession XM_032996) is another VGAM2330 host target gene. KIAA0819 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0819 BINDING SITE, designated SEQ ID:31807, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79181] Another function of VGAM2330 is therefore inhibition of KIAA0819 (Accession XM_032996). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0819. KIAA1437 (Accession XM_026998) is another VGAM2330 host target gene. KIAA1437 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1437 BINDING SITE, designated SEQ ID:30387, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79182] Another function of VGAM2330 is therefore inhibition of KIAA1437 (Accession XM_026998). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1437. MGC20470 (Accession NM_145053) is another VGAM2330 host target gene. MGC20470 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20470, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20470 BINDING SITE, designated SEQ ID:29685, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79183] Another function of VGAM2330 is therefore inhibition of MGC20470 (Accession NM_145053). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20470. MGC4796 (Accession XM_029031) is another VGAM2330 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30831, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79184] Another function of VGAM2330 is therefore inhibition of MGC4796 (Accession XM_029031). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC4796. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM2330 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30681, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79185] Another function of VGAM2330 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM_021168) is another VGAM2330 host target gene. RAB40C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB40C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RAB40C BINDING SITE, designated SEQ ID:22146, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79186] Another function of VGAM2330 is therefore inhibition of RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM_021168). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40C. RER1 (Accession NM_007033) is another VGAM2330 host target gene. RER1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RER1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RER1 BINDING SITE, designated SEQ ID:13903, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79187] Another function of VGAM2330 is therefore inhibition of RER1 (Accession NM_007033). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RER1. Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654)

is another VGAM2330 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16090, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79188] Another function of VGAM2330 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. LOC116411 (Accession XM_058095) is another VGAM2330 host target gene. LOC116411 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC116411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE, designated SEQ ID:36569, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5041.

[79189] Another function of VGAM2330 is therefore inhibition of LOC116411 (Accession XM_058095). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC129880 (Accession XM_059383) is another VGAM2330 host target gene. LOC129880 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC129880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129880 BINDING SITE, designated SEQ ID:36983, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79190] Another function of VGAM2330 is therefore inhibition of LOC129880 (Accession XM_059383). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129880. LOC149422 (Accession XM_086527) is another VGAM2330 host target gene. LOC149422 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149422, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149422 BINDING SITE, designated SEQ ID:38744, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79191] Another function of VGAM2330 is therefore inhibition of LOC149422 (Accession XM_086527). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149422. LOC154043 (Accession XM_087831) is another VGAM2330 host target gene. LOC154043 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154043 BINDING SITE, designated SEQ ID:39459, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79192] Another function of VGAM2330 is therefore inhibition of LOC154043 (Accession XM_087831). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC154043. LOC155382 (Accession XM_098713) is another VGAM2330 host target gene. LOC155382 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155382 BINDING SITE, designated SEQ ID:41766, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79193] Another function of VGAM2330 is therefore inhibition of LOC155382 (Accession XM_098713). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155382. LOC158364 (Accession XM_088546) is another VGAM2330 host target gene. LOC158364 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158364 BINDING SITE, designated SEQ ID:39816, to

the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79194] Another function of VGAM2330 is therefore inhibition of LOC158364 (Accession XM_088546). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158364. LOC170393 (Accession XM_096327) is another VGAM2330 host target gene. LOC170393 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC170393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170393 BINDING SITE, designated SEQ ID:40312, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79195] Another function of VGAM2330 is therefore inhibition of LOC170393 (Accession XM_096327). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170393. LOC202868 (Accession XM_117477) is another VGAM2330 host target gene. LOC202868 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC202868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202868 BINDING SITE, designated SEQ ID:43449, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79196] Another function of VGAM2330 is therefore inhibition of LOC202868 (Accession XM_117477). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202868. LOC219649 (Accession XM_167562) is another VGAM2330 host target gene. LOC219649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219649 BINDING SITE, designated SEQ ID:44665, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79197] Another function of VGAM2330 is therefore inhibition of LOC219649 (Accession XM_167562). Accordingly, utilities

of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649. LOC253664 (Accession XM_170673) is another VGAM2330 host target gene. LOC253664 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253664 BINDING SITE, designated SEQ ID:45451, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79198] Another function of VGAM2330 is therefore inhibition of LOC253664 (Accession XM_170673). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253664. LOC256306 (Accession XM_172976) is another VGAM2330 host target gene. LOC256306 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256306 BINDING SITE, designated SEQ ID:46238, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79199] Another function of VGAM2330 is therefore inhibition of LOC256306 (Accession XM_172976). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306. LOC90198 (Accession XM_029882) is another VGAM2330 host target gene. LOC90198 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90198 BINDING SITE, designated SEQ ID:30959, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79200] Another function of VGAM2330 is therefore inhibition of LOC90198 (Accession XM_029882). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90198. LOC90249 (Accession XM_030300) is another VGAM2330 host target gene. LOC90249 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90249 BINDING SITE, designated SEQ ID:31009, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79201] Another function of VGAM2330 is therefore inhibition of LOC90249 (Accession XM_030300). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90249. LOC91064 (Accession XM_035806) is another VGAM2330 host target gene. LOC91064 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91064 BINDING SITE, designated SEQ ID:32341, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79202] Another function of VGAM2330 is therefore inhibition of

LOC91064 (Accession XM_035806). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91064. LOC91355 (Accession XM_037825) is another VGAM2330 host target gene. LOC91355 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91355 BINDING SITE, designated SEQ ID:32703, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79203] Another function of VGAM2330 is therefore inhibition of LOC91355 (Accession XM_037825). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91355. LOC92697 (Accession XM_046715) is another VGAM2330 host target gene. LOC92697 BINDING SITE1 and LOC92697 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC92697, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE1 and LOC92697 BINDING SITE2, designated SEQ ID:34802 and SEQ ID:34803 respectively, to the nucleotide sequence of VGAM2330 RNA, herein designated VGAM RNA, also designated SEQ ID:5041.

[79204] Another function of VGAM2330 is therefore inhibition of LOC92697 (Accession XM_046715). Accordingly, utilities of VGAM2330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92697. Placental Growth Factor, Vascular Endothelial Growth Factor-related Protein (PGF, Accession NM_002632) is another VGAM2331 host target gene. PGF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGF BINDING SITE, designated SEQ ID:8490, to the nucleotide sequence of VGAM2331 RNA, herein designated VGAM RNA, also designated SEQ ID:5042.

[79205] Another function of VGAM2331 is therefore inhibition of Placental Growth Factor, Vascular Endothelial Growth Fac-

tor-related Protein (PGF, Accession NM_002632), a gene which is a growth factor active in angiogenesis, and endothelial cell growth, stimulating cell proliferation and migration. it binds to receptor vegfr-1/fl. Accordingly, utilities of VGAM2331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGF. The function of PGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1420.Organic Cationic Transporter-like 3 (ORCTL3, Accession NM_004256) is another VGAM2331 host target gene. ORCTL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ORCTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORCTL3 BINDING SITE, designated SEQ ID:10442, to the nucleotide sequence of VGAM2331 RNA, herein designated VGAM RNA, also designated SEQ ID:5042.

[79206] Another function of VGAM2331 is therefore inhibition of Organic Cationic Transporter-like 3 (ORCTL3, Accession NM_004256). Accordingly, utilities of VGAM2331 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ORCTL3. LOC202459 (Accession NM_145303) is another VGAM2331 host target gene. LOC202459 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202459 BINDING SITE, designated SEQ ID:29815, to the nucleotide sequence of VGAM2331 RNA, herein designated VGAM RNA, also designated SEQ ID:5042.

[79207] Another function of VGAM2331 is therefore inhibition of LOC202459 (Accession NM_145303). Accordingly, utilities of VGAM2331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2332 (VGAM2332) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79208] VGAM2332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2332 was detected is described hereinabove with reference to Figs. 1-8.

[79209] VGAM2332 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79210] VGAM2332 gene encodes a VGAM2332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2332 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2332 precursor RNA is designated SEQ ID:2318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2318 is located at position 21991 relative to the genome of Equine Herpesvirus 2.

[79211] VGAM2332 precursor RNA folds onto itself, forming VGAM2332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79212] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2332 folded precursor RNA into VGAM2332 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2332 RNA is designated SEQ ID:5043, and is provided hereinbelow with reference to the sequence listing part.

[79213] VGAM2332 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2332 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[79214] VGAM2332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2332 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2332 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79215] The complementary binding of VGAM2332 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2332 host target RNA into VGAM2332 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79216] It is appreciated that VGAM2332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2332 host target genes. The mRNA of each one of this plurality of VGAM2332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2332 RNA, herein designated VGAM RNA, and which when bound by VGAM2332 RNA causes inhibition of translation of respective one or more VGAM2332 host target proteins.

[79217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2332 gene, herein designated VGAM GENE, on one or more VGAM2332 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79218] It is yet further appreciated that a function of VGAM2332 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2332 correlate with, and may be deduced from, the identity of the host target genes which VGAM2332 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79219] Nucleotide sequences of the VGAM2332 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2332 are further described hereinbelow with reference to Table 1.

[79220] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2332 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79221] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2332 gene, herein designated VGAM is inhibition of expression of VGAM2332 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2332 correlate with, and may be deduced from, the identity of the target genes which VGAM2332 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79222] 5-hydroxytryptamine (serotonin) Receptor 6 (HTR6, Accession NM_000871) is a VGAM2332 host target gene.

HTR6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HTR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR6 BINDING SITE, designated SEQ ID:6547, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79223] A function of VGAM2332 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 6 (HTR6, Accession NM_000871), a gene which stimulates adenylate cyclase. Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR6. The function of HTR6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM326.FLJ10043 (Accession NM_017979) is another VGAM2332 host target gene. FLJ10043 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ10043 BINDING SITE, designated SEQ ID:19708, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79224] Another function of VGAM2332 is therefore inhibition of FLJ10043 (Accession NM_017979). Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10043. FLJ20694 (Accession NM_017928) is another VGAM2332 host target gene. FLJ20694 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20694 BINDING SITE, designated SEQ ID:19605, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79225] Another function of VGAM2332 is therefore inhibition of FLJ20694 (Accession NM_017928). Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20694. KIAA0798 (Accession NM_014650) is another

VGAM2332 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16066, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79226] Another function of VGAM2332 is therefore inhibition of KIAA0798 (Accession NM_014650). Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0798. KLK15 (Accession NM_138563) is another VGAM2332 host target gene. KLK15 BINDING SITE1 and KLK15 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK15, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK15 BINDING SITE1 and KLK15 BINDING SITE2, designated SEQ ID:28862 and SEQ ID:23264 respectively, to the nucleotide sequence of VGAM2332 RNA,

herein designated VGAM RNA, also designated SEQ ID:5043.

[79227] Another function of VGAM2332 is therefore inhibition of KLK15 (Accession NM_138563). Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK15. LOC121838 (Accession XM_071772) is another VGAM2332 host target gene. LOC121838 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC121838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121838 BINDING SITE, designated SEQ ID:37418, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79228] Another function of VGAM2332 is therefore inhibition of LOC121838 (Accession XM_071772). Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121838. LOC220739 (Accession XM_167548) is another VGAM2332 host target gene. LOC220739 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC220739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:44654, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79229] Another function of VGAM2332 is therefore inhibition of LOC220739 (Accession XM_167548). Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220739. LOC222066 (Accession XM_166582) is another VGAM2332 host target gene. LOC222066 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE, designated SEQ ID:44555, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79230] Another function of VGAM2332 is therefore inhibition of LOC222066 (Accession XM_166582). Accordingly, utilities

of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066. LOC254685 (Accession XM_172876) is another VGAM2332 host target gene. LOC254685 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254685 BINDING SITE, designated SEQ ID:46152, to the nucleotide sequence of VGAM2332 RNA, herein designated VGAM RNA, also designated SEQ ID:5043.

[79231] Another function of VGAM2332 is therefore inhibition of LOC254685 (Accession XM_172876). Accordingly, utilities of VGAM2332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254685. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2333 (VGAM2333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79232] VGAM2333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2333 was detected is described hereinabove with reference to Figs. 1-8.

[79233] VGAM2333 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79234] VGAM2333 gene encodes a VGAM2333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2333 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2333 precursor RNA is designated SEQ ID:2319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2319 is located at position 36149 relative to the genome of Equine Herpesvirus 2.

[79235] VGAM2333 precursor RNA folds onto itself, forming VGAM2333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79236] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2333 folded precursor RNA into VGAM2333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2333 RNA is designated SEQ ID:5044, and is provided hereinbelow with reference to the sequence listing part.

[79237] VGAM2333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2333 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[79238] VGAM2333 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2333 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79239] The complementary binding of VGAM2333 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2333 host target RNA into VGAM2333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79240] It is appreciated that VGAM2333 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2333 host target genes. The mRNA of each one of this plurality of VGAM2333 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2333 RNA, herein designated VGAM RNA, and which when bound by VGAM2333 RNA causes inhibition of translation of respective one or more VGAM2333 host target proteins.

[79241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2333 gene, herein designated VGAM GENE, on one or more VGAM2333 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79242] It is yet further appreciated that a function of VGAM2333 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2333 correlate with, and may be deduced from, the identity of the host target genes which VGAM2333 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79243] Nucleotide sequences of the VGAM2333 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2333 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2333 are further described hereinbelow with reference to Table 1.

[79244] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2333 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79245] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2333 gene, herein designated VGAM is inhibition of expression of VGAM2333 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2333 correlate with, and may be deduced from, the identity of the target genes which VGAM2333 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79246] GLI-Kruppel Family Member GLI2 (GLI2, Accession NM_030379) is a VGAM2333 host target gene. GLI2 BIND-

ING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GLI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLI2 BINDING SITE, designated SEQ ID:24937, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79247] A function of VGAM2333 is therefore inhibition of GLI-Kruppel Family Member GLI2 (GLI2, Accession NM_030379), a gene which may promote tax-dependent transcription of T-cell leukemia virus type 1 genes. Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLI2. The function of GLI2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM465.Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM_044421) is another VGAM2333 host target gene. SLC19A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC19A2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A2 BINDING SITE, designated SEQ ID:34193, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79248] Another function of VGAM2333 is therefore inhibition of Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM_044421). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A2. FLJ11210 (Accession XM_005298) is another VGAM2333 host target gene. FLJ11210 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11210 BINDING SITE, designated SEQ ID:29973, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79249] Another function of VGAM2333 is therefore inhibition of FLJ11210 (Accession XM_005298). Accordingly, utilities of

VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11210. FLJ22167 (Accession NM_024533) is another VGAM2333 host target gene. FLJ22167 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:23744, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79250] Another function of VGAM2333 is therefore inhibition of FLJ22167 (Accession NM_024533). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167. KIAA0285 (Accession NM_014807) is another VGAM2333 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0285 BINDING SITE, designated SEQ ID:16755, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79251] Another function of VGAM2333 is therefore inhibition of KIAA0285 (Accession NM_014807). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0635 (Accession NM_014645) is another VGAM2333 host target gene. KIAA0635 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0635 BINDING SITE, designated SEQ ID:16057, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79252] Another function of VGAM2333 is therefore inhibition of KIAA0635 (Accession NM_014645). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0635. KIAA1656 (Accession XM_038022) is another VGAM2333 host target gene. KIAA1656 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32737, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79253] Another function of VGAM2333 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. LIG-1 (Accession XM_033712) is another VGAM2333 host target gene. LIG-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31956, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79254] Another function of VGAM2333 is therefore inhibition of

LIG-1 (Accession XM_033712). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. PFTAIRE Protein Kinase 1 (PFTK1, Accession NM_012395) is another VGAM2333 host target gene. PFTK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PFTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE, designated SEQ ID:14750, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79255] Another function of VGAM2333 is therefore inhibition of PFTAIRE Protein Kinase 1 (PFTK1, Accession NM_012395). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1. LOC255565 (Accession XM_170811) is another VGAM2333 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255565 BINDING SITE, designated SEQ ID:45592, to the nucleotide sequence of VGAM2333 RNA, herein designated VGAM RNA, also designated SEQ ID:5044.

[79256] Another function of VGAM2333 is therefore inhibition of LOC255565 (Accession XM_170811). Accordingly, utilities of VGAM2333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2334 (VGAM2334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79257] VGAM2334 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2334 was detected is described hereinabove with reference to Figs. 1-8.

[79258] VGAM2334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2334 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[79259] VGAM2334 gene encodes a VGAM2334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2334 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2334 precursor RNA is designated SEQ ID:2320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2320 is located at position 40967 relative to the genome of Equine Herpesvirus 2.

[79260] VGAM2334 precursor RNA folds onto itself, forming VGAM2334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79261] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2334 folded precursor RNA into VGAM2334

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2334 RNA is designated SEQ ID:5045, and is provided hereinbelow with reference to the sequence listing part.

[79262] VGAM2334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2334 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79263] VGAM2334 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2334 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79264] The complementary binding of VGAM2334 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2334 host target RNA into VGAM2334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[79265] It is appreciated that VGAM2334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2334 host target genes. The mRNA of each one of this plurality of VGAM2334 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2334 RNA, herein designated VGAM RNA, and which when bound by VGAM2334 RNA causes inhibition of translation of respective one or more VGAM2334 host target proteins.

[79266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2334 gene, herein designated VGAM GENE, on one or more VGAM2334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79267] It is yet further appreciated that a function of VGAM2334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2334 correlate with, and may be deduced from, the identity of the host target genes which VGAM2334 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79268] Nucleotide sequences of the VGAM2334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2334 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2334 are further described hereinbelow with reference to Table 1.

[79269] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2334 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79270] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2334 gene, herein designated VGAM is inhibition of expression of VGAM2334 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2334 correlate with, and may be deduced from, the identity of the target genes which VGAM2334 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79271] Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM_049795) is a VGAM2334 host target gene. EIF3S10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF3S10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF3S10 BINDING SITE, designated SEQ ID:35499, to the nucleotide

sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79272] A function of VGAM2334 is therefore inhibition of Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM_049795), a gene which binds to the 40s ribosome and promotes the binding of methionyl-trnai and mrna. Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF3S10. The function of EIF3S10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM882.Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM_024009) is another VGAM2334 host target gene. GJB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GJB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB3 BINDING SITE, designated SEQ ID:23435, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79273] Another function of VGAM2334 is therefore inhibition of Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM_024009). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB3. Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM_009220) is another VGAM2334 host target gene. GNA15 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNA15 BINDING SITE, designated SEQ ID:30102, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79274] Another function of VGAM2334 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM_009220). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA15. Huntingtin Interacting Protein 1 (HIP1, Accession NM_005338) is another VGAM2334 host target

gene. HIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIP1 BINDING SITE, designated SEQ ID:11810, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79275] Another function of VGAM2334 is therefore inhibition of Huntingtin Interacting Protein 1 (HIP1, Accession NM_005338), a gene which is a membrane protein and interacts with huntingtin. Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP1. The function of HIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM474.Human Immunodeficiency Virus Type I Enhancer Binding Protein 3 (HIVEP3, Accession NM_024503) is another VGAM2334 host target gene. HIVEP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HIVEP3, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIVEP3 BINDING SITE, designated SEQ ID:23697, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79276] Another function of VGAM2334 is therefore inhibition of Human Immunodeficiency Virus Type I Enhancer Binding Protein 3 (HIVEP3, Accession NM_024503), a gene which is required for transcriptional activation of glucose- repressible alcohol dehydrogenase (adh2). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIVEP3. The function of HIVEP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1781.Serine/threonine Kinase 10 (STK10, Accession NM_005990) is another VGAM2334 host target gene. STK10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK10 BINDING SITE, des-

ignated SEQ ID:12612, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79277] Another function of VGAM2334 is therefore inhibition of Serine/threonine Kinase 10 (STK10, Accession NM_005990), a gene which can act on substrates such as myelin basic protein and histone iia on serine and threonine residues. Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK10. The function of STK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM_004842) is another VGAM2334 host target gene. AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3, designated SEQ ID:11252, SEQ ID:18515 and SEQ ID:28905 respectively,

to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79278] Another function of VGAM2334 is therefore inhibition of A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM_004842). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP7. Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM_033576) is another VGAM2334 host target gene. C5orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C5orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf7 BINDING SITE, designated SEQ ID:31939, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79279] Another function of VGAM2334 is therefore inhibition of Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM_033576). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf7. FLJ10081 (Accession NM_017991) is another VGAM2334 host target

gene. FLJ10081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10081 BINDING SITE, designated SEQ ID:19721, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79280] Another function of VGAM2334 is therefore inhibition of FLJ10081 (Accession NM_017991). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10081. FLJ13491 (Accession NM_024623) is another VGAM2334 host target gene. FLJ13491 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13491 BINDING SITE, designated SEQ ID:23885, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79281] Another function of VGAM2334 is therefore inhibition of FLJ13491 (Accession NM_024623). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13491. FLJ21308 (Accession NM_024615) is another VGAM2334 host target gene. FLJ21308 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21308 BINDING SITE, designated SEQ ID:23877, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79282] Another function of VGAM2334 is therefore inhibition of FLJ21308 (Accession NM_024615). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21308. FLJ21918 (Accession NM_024939) is another VGAM2334 host target gene. FLJ21918 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21918 BINDING SITE, designated SEQ ID:24481, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79283] Another function of VGAM2334 is therefore inhibition of FLJ21918 (Accession NM_024939). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21918. FLJ22173 (Accession NM_025041) is another VGAM2334 host target gene. FLJ22173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22173 BINDING SITE, designated SEQ ID:24634, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79284] Another function of VGAM2334 is therefore inhibition of FLJ22173 (Accession NM_025041). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22173. KIAA1155 (Accession XM_030864) is another VGAM2334 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31193, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79285] Another function of VGAM2334 is therefore inhibition of KIAA1155 (Accession XM_030864). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. KIAA1560 (Accession XM_034422) is another VGAM2334 host target gene. KIAA1560 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32098, to the nucleotide sequence of VGAM2334 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5045.

[79286] Another function of VGAM2334 is therefore inhibition of KIAA1560 (Accession XM_034422). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1560. KIAA1764 (Accession XM_045086) is another VGAM2334 host target gene. KIAA1764 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1764 BINDING SITE, designated SEQ ID:34351, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79287] Another function of VGAM2334 is therefore inhibition of KIAA1764 (Accession XM_045086). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1764. KIAA1936 (Accession XM_056082) is another VGAM2334 host target gene. KIAA1936 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1936, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1936 BINDING SITE, designated SEQ ID:36362, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79288] Another function of VGAM2334 is therefore inhibition of KIAA1936 (Accession XM_056082). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1936. LOC150605 (Accession XM_097927) is another VGAM2334 host target gene. LOC150605 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150605 BINDING SITE, designated SEQ ID:41227, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79289] Another function of VGAM2334 is therefore inhibition of LOC150605 (Accession XM_097927). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150605. LOC157858 (Accession XM_098833) is another VGAM2334 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:41864, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79290] Another function of VGAM2334 is therefore inhibition of LOC157858 (Accession XM_098833). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858. LOC254057 (Accession XM_173085) is another VGAM2334 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46341, to

the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79291] Another function of VGAM2334 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC90485 (Accession XM_032059) is another VGAM2334 host target gene. LOC90485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90485 BINDING SITE, designated SEQ ID:31552, to the nucleotide sequence of VGAM2334 RNA, herein designated VGAM RNA, also designated SEQ ID:5045.

[79292] Another function of VGAM2334 is therefore inhibition of LOC90485 (Accession XM_032059). Accordingly, utilities of VGAM2334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90485. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2335 (VGAM2335) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79293] VGAM2335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2335 was detected is described hereinabove with reference to Figs. 1-8.

[79294] VGAM2335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79295] VGAM2335 gene encodes a VGAM2335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2335 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2335 precursor RNA is designated SEQ ID:2321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2321 is located at position 42087 relative to the genome of Equine Herpesvirus 2.

[79296] VGAM2335 precursor RNA folds onto itself, forming VGAM2335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79297] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2335 folded precursor RNA into VGAM2335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2335 RNA is designated SEQ ID:5046, and is provided hereinbelow with reference to the sequence listing part.

[79298] VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2335 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2335 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79299] VGAM2335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2335 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79300] The complementary binding of VGAM2335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2335 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2335 host target RNA into VGAM2335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79301] It is appreciated that VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2335 host target genes. The mRNA of each one of this plurality of VGAM2335 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2335 RNA, herein designated VGAM RNA, and which when bound by VGAM2335 RNA causes inhibition of translation of respective one or more VGAM2335 host target proteins.

[79302] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2335 gene, herein designated VGAM GENE, on one or more VGAM2335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79303] It is yet further appreciated that a function of VGAM2335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2335 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79304] Nucleotide sequences of the VGAM2335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2335 are further described hereinbelow with reference to Table 1.

[79305] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2335 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2335 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79306] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2335 gene, herein designated VGAM is inhibition of expression of VGAM2335 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2335 correlate with, and may be deduced from, the identity of the target genes which VGAM2335

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79307] CARPX (Accession NM_020178) is a VGAM2335 host target gene. CARPX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARPX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARPX BINDING SITE, designated SEQ ID:21396, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79308] A function of VGAM2335 is therefore inhibition of CARPX (Accession NM_020178), a gene which is alpha-carbonic anhydrases-related protein. Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARPX. The function of CARPX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM904.PLAB (Accession XM_038098) is another VGAM2335 host target gene. PLAB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by PLAB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAB BINDING SITE, designated SEQ ID:32753, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79309] Another function of VGAM2335 is therefore inhibition of PLAB (Accession XM_038098), a gene which regulates tissue differentiation and maintenance. Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAB. The function of PLAB has been established by previous studies. Bone morphogenetic proteins (e.g., BMP5; 112265) are members of the transforming growth factor-beta (see OMIM Ref. No. TGFB1; 190180) superfamily and regulate tissue differentiation and maintenance. They are synthesized as precursor molecules that are processed at a dibasic cleavage site to release C-terminal domains containing a characteristic motif of 7 conserved cysteines in the mature protein. By screening a full-length cDNA library constructed from a fibrosarcoma cell line for secretory proteins, Yokoyama-Kobayashi et al. (1997) isolated

a cDNA encoding a 308-amino acid protein related to TGFB. Northern blot analysis detected strongest expression of a 1.35-kb transcript in placenta, with lower levels in prostate and colon and some expression in kidney. By searching an EST database for TGFB/BMP-related sequences, Hromas et al. (1997) identified a cDNA encoding an identical protein, which they called PLAB (placental BMP). Through analysis of hematopoietic progenitor proliferation, they found that PLAB reduces the growth of granulocytes and macrophages. By searching an EST database, followed by screening a placental cDNA library, Paralkar et al. (1998) isolated a cDNA encoding PLAB, which they called PDF (prostate-derived factor). Western blot analysis showed that PDF is expressed as a 16-kD protein under reducing conditions. In situ hybridization and immunohistochemical analysis demonstrated that PDF is expressed at high levels in cells of the terminal villi in placenta and in the epithelium of prostate but not in other accessory male genital glands. Using subtraction cloning in a monocyte/macrophage cell line, Bootcov et al. (1997) isolated a cDNA encoding PLAB, which they called MIC1 (macrophage-inhibiting cytokine-1). Sequence analysis predicted that the mature secreted MIC1 protein contains

224 amino acids. Northern blot analysis showed that MIC1 is not expressed in undifferentiated cells but is progressively upregulated upon differentiation with retinoic acid followed by phorbol ester or cytokine (e.g., TNFA; 191160) treatment. Exposure of macrophages to MIC1 or TGFB1, followed by stimulation with lipopolysaccharide, suppressed the production of TNFA. Unlike most TGFB superfamily members, in which the amino acid sequence is completely conserved, MIC1 shares only 70% amino acid identity with its rodent counterparts (Bottner et al., 1999). Using FISH, Bottner et al. (1999) mapped the MIC1 gene to 19p13.2-p13.1.

[79310] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[79311] Paralkar, V. M.; Vail, A. L.; Grasser, W. A.; Brown, T. A.; Xu, H.; Vukicevic, S.; Ke, H. Z.; Qi, H.; Owen, T. A.; Thompson, D. D. : Cloning and characterization of a novel member of the transforming growth factor-beta/bone morphogenetic protein family. J. Biol. Chem. 273: 13760-13767, 1998. ; and

[79312] Yokoyama-Kobayashi, M.; Saeki, M.; Sekine, S.; Kato, S. : Human cDNA encoding a novel TGF-beta superfamily pro-

tein highly expressed in placenta. J. Biochem. 122: 622-626, 1997.

[79313] Further studies establishing the function and utilities of PLAB are found in John Hopkins OMIM database record ID 605312, and in sited publications numbered 7446-745 and 7454-7452 listed in the bibliography section herein-below, which are also hereby incorporated by refer-ence.FLJ21916 (Accession NM_023112) is another VGAM2335 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-ING SITE II or BINDING SITE III. Table 2 illustrates the com-plementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:23379, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79314] Another function of VGAM2335 is therefore inhibition of FLJ21916 (Accession NM_023112). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21916. FLJ23233 (Accession NM_024691) is another VGAM2335 host target gene. FLJ23233 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23233 BINDING SITE, designated SEQ ID:24000, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79315] Another function of VGAM2335 is therefore inhibition of FLJ23233 (Accession NM_024691). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23233. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958) is another VGAM2335 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10094, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79316] Another function of VGAM2335 is therefore inhibition of

Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8. LOC149461 (Accession XM_086547) is another VGAM2335 host target gene. LOC149461 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149461 BINDING SITE, designated SEQ ID:38762, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79317] Another function of VGAM2335 is therefore inhibition of LOC149461 (Accession XM_086547). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149461. LOC152018 (Accession XM_098156) is another VGAM2335 host target gene. LOC152018 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152018, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152018 BINDING SITE, designated SEQ ID:41420, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79318] Another function of VGAM2335 is therefore inhibition of LOC152018 (Accession XM_098156). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152018. LOC164684 (Accession XM_092926) is another VGAM2335 host target gene. LOC164684 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC164684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164684 BINDING SITE, designated SEQ ID:40160, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79319] Another function of VGAM2335 is therefore inhibition of LOC164684 (Accession XM_092926). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC164684. LOC203083 (Accession XM_117496) is another VGAM2335 host target gene. LOC203083 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203083 BINDING SITE, designated SEQ ID:43477, to the nucleotide sequence of VGAM2335 RNA, herein designated VGAM RNA, also designated SEQ ID:5046.

[79320] Another function of VGAM2335 is therefore inhibition of LOC203083 (Accession XM_117496). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203083. LOC254176 (Accession XM_173215) is another VGAM2335 host target gene. LOC254176 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254176 BINDING SITE, designated SEQ ID:46474, to the nucleotide sequence of VGAM2335 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5046.

[79321] Another function of VGAM2335 is therefore inhibition of LOC254176 (Accession XM_173215). Accordingly, utilities of VGAM2335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254176. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2336 (VGAM2336) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79322] VGAM2336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2336 was detected is described hereinabove with reference to Figs. 1-8.

[79323] VGAM2336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79324] VGAM2336 gene encodes a VGAM2336 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2336 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2336 precursor RNA is designated SEQ ID:2322, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2322 is located at position 40488 relative to the genome of Equine Herpesvirus 2.

[79325] VGAM2336 precursor RNA folds onto itself, forming VGAM2336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79326] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2336 folded precursor RNA into VGAM2336 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2336 RNA is designated SEQ ID:5047, and is provided hereinbelow with reference to the sequence listing part.

[79327] VGAM2336 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2336 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79328] VGAM2336 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2336 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2336 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79329] The complementary binding of VGAM2336 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2336 host target RNA into VGAM2336 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79330] It is appreciated that VGAM2336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2336 host target genes. The mRNA of

each one of this plurality of VGAM2336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2336 RNA, herein designated VGAM RNA, and which when bound by VGAM2336 RNA causes inhibition of translation of respective one or more VGAM2336 host target proteins.

[79331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2336 gene, herein designated VGAM GENE, on one or more VGAM2336 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[79332] It is yet further appreciated that a function of VGAM2336 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2336 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2336 correlate with, and may be deduced from, the identity of the host target genes which VGAM2336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79333] Nucleotide sequences of the VGAM2336 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2336 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2336 are further described hereinbelow with reference to Table 1.

[79334] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2336 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2336 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79335] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2336 gene, herein designated VGAM is inhibition of expression of VGAM2336 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2336 correlate with, and may be deduced from, the identity of the target genes which VGAM2336 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79336] ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916) is a VGAM2336 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44922, to the nucleotide sequence of VGAM2336 RNA, herein designated VGAM RNA, also designated SEQ ID:5047.

[79337] A function of VGAM2336 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A,

Member 2 (ATP8A2, Accession XM_167916). Accordingly, utilities of VGAM2336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. KIAA0218 (Accession NM_014760) is another VGAM2336 host target gene. KIAA0218 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0218 BINDING SITE, designated SEQ ID:16517, to the nucleotide sequence of VGAM2336 RNA, herein designated VGAM RNA, also designated SEQ ID:5047.

[79338] Another function of VGAM2336 is therefore inhibition of KIAA0218 (Accession NM_014760). Accordingly, utilities of VGAM2336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0218. KIAA0570 (Accession NM_014709) is another VGAM2336 host target gene. KIAA0570 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0570, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0570 BINDING SITE, designated SEQ ID:16255, to the nucleotide sequence of VGAM2336 RNA, herein designated VGAM RNA, also designated SEQ ID:5047.

[79339] Another function of VGAM2336 is therefore inhibition of KIAA0570 (Accession NM_014709). Accordingly, utilities of VGAM2336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0570. Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679) is another VGAM2336 host target gene. RHOBTB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB2 BINDING SITE, designated SEQ ID:30560, to the nucleotide sequence of VGAM2336 RNA, herein designated VGAM RNA, also designated SEQ ID:5047.

[79340] Another function of VGAM2336 is therefore inhibition of Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679). Accordingly, utilities of VGAM2336 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RHOBTB2. LOC149910 (Accession XM_086699) is another VGAM2336 host target gene. LOC149910 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149910 BINDING SITE, designated SEQ ID:38826, to the nucleotide sequence of VGAM2336 RNA, herein designated VGAM RNA, also designated SEQ ID:5047.

[79341] Another function of VGAM2336 is therefore inhibition of LOC149910 (Accession XM_086699). Accordingly, utilities of VGAM2336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149910. LOC151361 (Accession XM_098048) is another VGAM2336 host target gene. LOC151361 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:41330, to

the nucleotide sequence of VGAM2336 RNA, herein designated VGAM RNA, also designated SEQ ID:5047.

[79342] Another function of VGAM2336 is therefore inhibition of LOC151361 (Accession XM_098048). Accordingly, utilities of VGAM2336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151361. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2337 (VGAM2337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79343] VGAM2337 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2337 was detected is described hereinabove with reference to Figs. 1-8.

[79344] VGAM2337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79345] VGAM2337 gene encodes a VGAM2337 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2337 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2337 precursor RNA is designated SEQ ID:2323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2323 is located at position 42439 relative to the genome of Equine Herpesvirus 2.

[79346] VGAM2337 precursor RNA folds onto itself, forming VGAM2337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79347] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2337 folded precursor RNA into VGAM2337 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2337 RNA is designated SEQ ID:5048, and is provided hereinbelow with reference to the sequence listing part.

[79348] VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2337 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79349] VGAM2337 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2337 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2337 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79350] The complementary binding of VGAM2337 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2337 host target RNA into VGAM2337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79351] It is appreciated that VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2337 host target genes. The mRNA of each one of this plurality of VGAM2337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2337 RNA, herein designated VGAM RNA, and which when bound by VGAM2337 RNA causes inhibition of translation of respective one or more VGAM2337 host target proteins.

[79352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2337 gene, herein designated VGAM GENE, on one or more VGAM2337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79353] It is yet further appreciated that a function of VGAM2337 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2337 correlate with, and may be deduced from, the identity of the host target genes which VGAM2337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79354] Nucleotide sequences of the VGAM2337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2337 are further described hereinbelow with reference to Table 1.

[79355] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2337 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79356] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2337 gene, herein designated VGAM is inhibition of expression of VGAM2337 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2337 correlate with, and may be deduced from, the identity of the target genes which VGAM2337 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79357] BRCA1 Associated Protein-1 (ubiquitin carboxy-terminal hydrolase) (BAP1, Accession NM_004656) is a VGAM2337 host target gene. BAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAP1 BINDING SITE, designated SEQ ID:11023, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79358] A function of VGAM2337 is therefore inhibition of BRCA1

Associated Protein-1 (ubiquitin carboxy-terminal hydrolase) (BAP1, Accession NM_004656). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAP1. Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM_015838) is another VGAM2337 host target gene. FCN2 BINDING SITE1 and FCN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FCN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCN2 BINDING SITE1 and FCN2 BINDING SITE2, designated SEQ ID:17951 and SEQ ID:17953 respectively, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79359] Another function of VGAM2337 is therefore inhibition of Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM_015838), a gene which is involved in phagocytosis of pathogens. Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCN2. The function of FCN2 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM493.BIKE (Accession NM_017593) is another VGAM2337 host target gene. BIKE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIKE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIKE BINDING SITE, designated SEQ ID:19040, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79360] Another function of VGAM2337 is therefore inhibition of BIKE (Accession NM_017593). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIKE. Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_032966) is another VGAM2337 host target gene. BLR1 BINDING SITE1 and BLR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BLR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLR1 BINDING SITE1 and BLR1 BINDING SITE2, designated SEQ ID:26774 and SEQ ID:7445 respectively, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79361] Another function of VGAM2337 is therefore inhibition of Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_032966). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLR1. CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838) is another VGAM2337 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36191, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79362] Another function of VGAM2337 is therefore inhibition of

CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. FLJ20435 (Accession NM_017821) is another VGAM2337 host target gene. FLJ20435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20435 BINDING SITE, designated SEQ ID:19469, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79363] Another function of VGAM2337 is therefore inhibition of FLJ20435 (Accession NM_017821). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20435. MAD4 (Accession NM_006454) is another VGAM2337 host target gene. MAD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD4 BINDING SITE, designated SEQ ID:13170, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79364] Another function of VGAM2337 is therefore inhibition of MAD4 (Accession NM_006454). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD4. MGC2721 (Accession NM_032737) is another VGAM2337 host target gene. MGC2721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2721 BINDING SITE, designated SEQ ID:26463, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79365] Another function of VGAM2337 is therefore inhibition of MGC2721 (Accession NM_032737). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2721. Nucleoredoxin (NXN, Accession NM_022463) is another VGAM2337 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22808, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79366] Another function of VGAM2337 is therefore inhibition of Nucleoredoxin (NXN, Accession NM_022463). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446) is another VGAM2337 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:11929, to the nucleotide se-

quence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79367] Another function of VGAM2337 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RXL1. TACTILE (Accession NM_005816) is another VGAM2337 host target gene. TACTILE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACTILE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACTILE BINDING SITE, designated SEQ ID:12410, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79368] Another function of VGAM2337 is therefore inhibition of TACTILE (Accession NM_005816). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACTILE. Zinc Finger Protein 213 (ZNF213, Accession XM_036493) is another VGAM2337 host target gene.

ZNF213 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF213 BINDING SITE, designated SEQ ID:32463, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also designated SEQ ID:5048.

[79369] Another function of VGAM2337 is therefore inhibition of Zinc Finger Protein 213 (ZNF213, Accession XM_036493). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF213. LOC257482 (Accession XM_168544) is another VGAM2337 host target gene. LOC257482 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257482 BINDING SITE, designated SEQ ID:45236, to the nucleotide sequence of VGAM2337 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5048.

[79370] Another function of VGAM2337 is therefore inhibition of LOC257482 (Accession XM_168544). Accordingly, utilities of VGAM2337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257482. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2338 (VGAM2338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79371] VGAM2338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2338 was detected is described hereinabove with reference to Figs. 1-8.

[79372] VGAM2338 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79373] VGAM2338 gene encodes a VGAM2338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2338 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2338 precursor RNA is designated SEQ ID:2324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2324 is located at position 36402 relative to the genome of Equine Herpesvirus 2.

[79374] VGAM2338 precursor RNA folds onto itself, forming VGAM2338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79375] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2338 folded precursor RNA into VGAM2338 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2338 RNA is designated SEQ ID:5049, and is provided hereinbelow with reference to the sequence listing part.

[79376] VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2338 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79377] VGAM2338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2338 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79378] The complementary binding of VGAM2338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2338 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2338 host target RNA into VGAM2338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79379] It is appreciated that VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2338 host target genes. The mRNA of

each one of this plurality of VGAM2338 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2338 RNA, herein designated VGAM RNA, and which when bound by VGAM2338 RNA causes inhibition of translation of respective one or more VGAM2338 host target proteins.

[79380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2338 gene, herein designated VGAM GENE, on one or more VGAM2338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[79381] It is yet further appreciated that a function of VGAM2338 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2338 correlate with, and may be deduced from, the identity of the host target genes which VGAM2338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79382] Nucleotide sequences of the VGAM2338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2338 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2338 are further described hereinbelow with reference to Table 1.

[79383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2338 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2338 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79384] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2338 gene, herein designated VGAM is inhibition of expression of VGAM2338 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2338 correlate with, and may be deduced from, the identity of the target genes which VGAM2338 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79385] Aquaporin 1 (channel-forming integral protein, 28kDa) (AQP1, Accession NM_000385) is a VGAM2338 host target gene. AQP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AQP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP1 BINDING SITE, designated SEQ ID:5960, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79386] A function of VGAM2338 is therefore inhibition of Aquaporin 1 (channel-forming integral protein, 28kDa) (AQP1, Accession NM_000385). Accordingly, utilities of

VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP1. UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 6 (B4GALT6, Accession XM_008799) is another VGAM2338 host target gene. B4GALT6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT6 BINDING SITE, designated SEQ ID:30092, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79387] Another function of VGAM2338 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 6 (B4GALT6, Accession XM_008799). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT6. B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633) is another VGAM2338 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6252, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79388] Another function of VGAM2338 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. Calcium-sensing Receptor (hypocalciuric hypercalcemia 1, severe neonatal hyperparathyroidism) (CASR, Accession NM_000388) is another VGAM2338 host target gene. CASR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CASR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASR BINDING SITE, designated SEQ ID:5961, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79389] Another function of VGAM2338 is therefore inhibition of Calcium-sensing Receptor (hypocalciuric hypercalcemia 1,

severe neonatal hyperparathyroidism) (CASR, Accession NM_000388). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASR. CERD4 (Accession NM_012074) is another VGAM2338 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14351, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79390] Another function of VGAM2338 is therefore inhibition of CERD4 (Accession NM_012074). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564) is another VGAM2338 host target gene. DGAT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGAT2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGAT2 BINDING SITE, designated SEQ ID:26289, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79391] Another function of VGAM2338 is therefore inhibition of Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT2. Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM_054111) is another VGAM2338 host target gene. IHPK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IHPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK3 BINDING SITE, designated SEQ ID:27659, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79392] Another function of VGAM2338 is therefore inhibition of Inositol Hexaphosphate Kinase 3 (IHPK3, Accession

NM_054111). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK3. Interleukin 17E (IL17E, Accession NM_022789) is another VGAM2338 host target gene. IL17E BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL17E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL17E BINDING SITE, designated SEQ ID:23070, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79393] Another function of VGAM2338 is therefore inhibition of Interleukin 17E (IL17E, Accession NM_022789), a gene which induces activation of nf-kappab and stimulates production of the proinflammatory chemokine il-8. Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL17E. The function of IL17E has been established by previous studies. By genomic DNA sequence analysis, Lee et al. (2001) identified a cDNA encoding IL17E. Sequence analysis predicted that the 177-amino

acid protein shares 16 to 20% identity with IL17, IL17B (OMIM Ref. No. 604627), and IL17C (OMIM Ref. No. 604628). These proteins share 20 to 30% identity in the C terminus, and all contain 4 conserved cysteine residues. Although Northern blot analysis revealed no IL17E expression, RT-PCR detected low-level expression in several tissues, including brain, kidney, lung, prostate, testis, spinal cord, adrenal gland, and trachea Treatment of mice in vivo with Il17e by Fort et al. (2001) resulted in induction of Th2-type cytokines, eosinophilia, increased serum immunoglobulin, and the development of histologic changes in lungs and the gastrointestinal tract. In contrast, other IL17-related cytokines induce proinflammatory cytokines and neutrophil migration. RT-PCR, ELISA, and flow cytometric analyses demonstrated that Il17e induces Th2-type cytokine expression and production by non-T, non-B accessory cells that express high levels of major histocompatibility complex class II and low levels of Cd11c (ITGAX; 151510).

[79394] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[79395] Lee, J.; Ho, W.-H.; Maruoka, M.; Corpuz, R. T.; Baldwin, D.

T.; Foster, J. S.; Goddard, A. D.; Yansura, D. G.; Vandlen, R. L.; Wood, W. L.; Gurney, A. L. : IL-17E, a novel proinflammatory ligand for the IL-17 receptor homolog IL-17Rh1. J. Biol. Chem. 276: 1660-1664, 2001. ; and

[79396] Fort, M. M.; Cheung, J.; Yen, D.; Li, J.; Zurawski, S. M.; Lo, S.; Menon, S.; Clifford, T.; Hunte, B.; Lesley, R.; Muchamuel, T.; Hurst, S. D.; Zurawski, G.; Leach, M. W.; Gorman, D. M.

[79397] Further studies establishing the function and utilities of IL17E are found in John Hopkins OMIM database record ID 605658, and in sited publications numbered 640 and 6408 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Interleukin 1 Receptor Antagonist (IL1RN, Accession NM_000577) is another VGAM2338 host target gene. IL1RN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1RN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RN BINDING SITE, designated SEQ ID:6178, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79398] Another function of VGAM2338 is therefore inhibition of Interleukin 1 Receptor Antagonist (IL1RN, Accession NM_000577), a gene which inhibits the activity of il-1 by binding to its receptor. il-1ra has no il-1 like activity. Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RN. The function of IL1RN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM2338 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22026, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79399] Another function of VGAM2338 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat ex-

pansion dsrna (by similarity). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608) is another VGAM2338 host target gene. PDGFB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFB BINDING SITE, designated SEQ ID:8468, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79400] Another function of VGAM2338 is therefore inhibition of Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608), a gene which plays an important role in stimulating adjacent cells to grow and thereby heal the

wound. Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFB. The function of PDGFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982) is another VGAM2338 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30600, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79401] Another function of VGAM2338 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PIK3R3. Peanut-like 1 (Drosophila) (PNUTL1, Accession NM_002688) is another VGAM2338 host target gene. PNUTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PNUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNUTL1 BINDING SITE, designated SEQ ID:8546, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79402] Another function of VGAM2338 is therefore inhibition of Peanut-like 1 (Drosophila) (PNUTL1, Accession NM_002688). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNUTL1. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012) is another VGAM2338 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BIND-

ING SITE, designated SEQ ID:8928, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79403] Another function of VGAM2338 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250.Teratocarcinoma-derived Growth Factor 1 (TDGF1, Accession NM_003212) is another VGAM2338 host target gene. TDGF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TDGF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TDGF1 BINDING SITE, designated SEQ ID:9209, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79404] Another function of VGAM2338 is therefore inhibition of Teratocarcinoma-derived Growth Factor 1 (TDGF1, Accession NM_003212), a gene which can play a role in the determination of the epiblastic cells that subsequently give rise to the mesoderm. Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDGF1. The function of TDGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1322.Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is another VGAM2338 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22061, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79405] Another function of VGAM2338 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Ac-

cession NM_021083). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769) is another VGAM2338 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44782, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79406] Another function of VGAM2338 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM_167769). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. DKFZP434E2135 (Accession NM_030804) is another VGAM2338 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434E2135,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25116, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79407] Another function of VGAM2338 is therefore inhibition of DKFZP434E2135 (Accession NM_030804). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. EFA6R (Accession NM_015310) is another VGAM2338 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17623, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79408] Another function of VGAM2338 is therefore inhibition of EFA6R (Accession NM_015310). Accordingly, utilities of

VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. FLJ10829 (Accession NM_018234) is another VGAM2338 host target gene. FLJ10829 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10829 BINDING SITE, designated SEQ ID:20179, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79409] Another function of VGAM2338 is therefore inhibition of FLJ10829 (Accession NM_018234). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10829. FLJ11608 (Accession NM_024557) is another VGAM2338 host target gene. FLJ11608 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11608

BINDING SITE, designated SEQ ID:23776, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79410] Another function of VGAM2338 is therefore inhibition of FLJ11608 (Accession NM_024557). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11608. FLJ20073 (Accession NM_017654) is another VGAM2338 host target gene. FLJ20073 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20073 BINDING SITE, designated SEQ ID:19164, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79411] Another function of VGAM2338 is therefore inhibition of FLJ20073 (Accession NM_017654). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20073. FLJ20274 (Accession XM_031455) is another VGAM2338 host target gene. FLJ20274 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20274 BINDING SITE, designated SEQ ID:31385, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79412] Another function of VGAM2338 is therefore inhibition of FLJ20274 (Accession XM_031455). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20274. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM2338 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26297, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79413] Another function of VGAM2338 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. GMPPB (Accession XM_171044) is another VGAM2338 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45809, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79414] Another function of VGAM2338 is therefore inhibition of GMPPB (Accession XM_171044). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. KIAA0143 (Accession XM_035825) is another VGAM2338 host target gene. KIAA0143 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0143, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0143 BINDING SITE, designated SEQ ID:32350, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79415] Another function of VGAM2338 is therefore inhibition of KIAA0143 (Accession XM_035825). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0143. KIAA0161 (Accession NM_014746) is another VGAM2338 host target gene. KIAA0161 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0161 BINDING SITE, designated SEQ ID:16429, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79416] Another function of VGAM2338 is therefore inhibition of KIAA0161 (Accession NM_014746). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0161. KIAA0495 (Accession XM_031397) is another VGAM2338 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31367, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79417] Another function of VGAM2338 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA0542 (Accession XM_038520) is another VGAM2338 host target gene. KIAA0542 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0542, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0542 BINDING SITE, designated SEQ ID:32858, to the

nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79418] Another function of VGAM2338 is therefore inhibition of KIAA0542 (Accession XM_038520). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0542. KIAA0774 (Accession XM_166270) is another VGAM2338 host target gene. KIAA0774 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0774 BINDING SITE, designated SEQ ID:44089, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79419] Another function of VGAM2338 is therefore inhibition of KIAA0774 (Accession XM_166270). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0774. KIAA1223 (Accession XM_048747) is another VGAM2338 host target gene. KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:35244, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79420] Another function of VGAM2338 is therefore inhibition of KIAA1223 (Accession XM_048747). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. LHPP (Accession NM_022126) is another VGAM2338 host target gene. LHPP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHPP BINDING SITE, designated SEQ ID:22673, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79421] Another function of VGAM2338 is therefore inhibition of LHPP (Accession NM_022126). Accordingly, utilities of

VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHPP. MGC14161 (Accession NM_032892) is another VGAM2338 host target gene. MGC14161 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC14161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14161 BINDING SITE, designated SEQ ID:26719, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79422] Another function of VGAM2338 is therefore inhibition of MGC14161 (Accession NM_032892). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14161. NECL1 (Accession NM_021189) is another VGAM2338 host target gene. NECL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NECL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NECL1 BINDING SITE,

designated SEQ ID:22164, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79423] Another function of VGAM2338 is therefore inhibition of NECL1 (Accession NM_021189). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NECL1. Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950) is another VGAM2338 host target gene. PRRG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:6652, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79424] Another function of VGAM2338 is therefore inhibition of Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1.

SEC14-like 1 (S. cerevisiae) (SEC14L1, Accession NM_003003) is another VGAM2338 host target gene. SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1 BINDING SITE, designated SEQ ID:8908, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79425] Another function of VGAM2338 is therefore inhibition of SEC14-like 1 (S. cerevisiae) (SEC14L1, Accession NM_003003). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L1. Sideroflexin 5 (SFXN5, Accession NM_144579) is another VGAM2338 host target gene. SFXN5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFXN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN5 BINDING SITE, des-

ignated SEQ ID:29387, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79426] Another function of VGAM2338 is therefore inhibition of Sideroflexin 5 (SFXN5, Accession NM_144579). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN5. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872) is another VGAM2338 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ ID:28111, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79427] Another function of VGAM2338 is therefore inhibition of Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC122553

(Accession XM_058630) is another VGAM2338 host target gene. LOC122553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36688, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79428] Another function of VGAM2338 is therefore inhibition of LOC122553 (Accession XM_058630). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC126823 (Accession XM_059086) is another VGAM2338 host target gene. LOC126823 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126823 BINDING SITE, designated SEQ ID:36864, to the nucleotide sequence of VGAM2338 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5049.

[79429] Another function of VGAM2338 is therefore inhibition of LOC126823 (Accession XM_059086). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126823. LOC132338 (Accession XM_067793) is another VGAM2338 host target gene. LOC132338 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132338 BINDING SITE, designated SEQ ID:37368, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79430] Another function of VGAM2338 is therefore inhibition of LOC132338 (Accession XM_067793). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132338. LOC146774 (Accession XM_085584) is another VGAM2338 host target gene. LOC146774 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146774, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146774 BINDING SITE, designated SEQ ID:38233, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79431] Another function of VGAM2338 is therefore inhibition of LOC146774 (Accession XM_085584). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146774. LOC149577 (Accession XM_097675) is another VGAM2338 host target gene. LOC149577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:41021, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79432] Another function of VGAM2338 is therefore inhibition of LOC149577 (Accession XM_097675). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149577. LOC158288 (Accession XM_098912) is another VGAM2338 host target gene. LOC158288 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158288 BINDING SITE, designated SEQ ID:41928, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79433] Another function of VGAM2338 is therefore inhibition of LOC158288 (Accession XM_098912). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158288. LOC163231 (Accession XM_092094) is another VGAM2338 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE, designated SEQ ID:40098, to

the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79434] Another function of VGAM2338 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. LOC255742 (Accession XM_171617) is another VGAM2338 host target gene. LOC255742 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255742 BINDING SITE, designated SEQ ID:46054, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79435] Another function of VGAM2338 is therefore inhibition of LOC255742 (Accession XM_171617). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255742. LOC85414 (Accession NM_033102) is another VGAM2338 host target gene. LOC85414 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC85414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85414 BINDING SITE, designated SEQ ID:26948, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79436] Another function of VGAM2338 is therefore inhibition of LOC85414 (Accession NM_033102). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85414. LOC90268 (Accession XM_030424) is another VGAM2338 host target gene. LOC90268 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90268 BINDING SITE, designated SEQ ID:31040, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79437] Another function of VGAM2338 is therefore inhibition of LOC90268 (Accession XM_030424). Accordingly, utilities

of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90268. LOC91801 (Accession NM_138775) is another VGAM2338 host target gene. LOC91801 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91801 BINDING SITE, designated SEQ ID:29008, to the nucleotide sequence of VGAM2338 RNA, herein designated VGAM RNA, also designated SEQ ID:5049.

[79438] Another function of VGAM2338 is therefore inhibition of LOC91801 (Accession NM_138775). Accordingly, utilities of VGAM2338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91801. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2339 (VGAM2339) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79439] VGAM2339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2339 was detected is described hereinabove with reference to Figs. 1-8.

[79440] VGAM2339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79441] VGAM2339 gene encodes a VGAM2339 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2339 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2339 precursor RNA is designated SEQ ID:2325, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2325 is located at position 42978 relative to the genome of Equine Herpesvirus 2.

[79442] VGAM2339 precursor RNA folds onto itself, forming VGAM2339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79443] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2339 folded precursor RNA into VGAM2339 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM2339 RNA is designated SEQ ID:5050, and is provided hereinbelow with reference to the sequence listing part.

[79444] VGAM2339 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2339 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[79445] VGAM2339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2339 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79446] The complementary binding of VGAM2339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2339 host target RNA into VGAM2339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79447] It is appreciated that VGAM2339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2339 host target genes. The mRNA of each one of this plurality of VGAM2339 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2339 RNA, herein designated VGAM RNA, and which when bound by VGAM2339 RNA causes inhibition of translation of respective one or more VGAM2339 host target proteins.

[79448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2339 gene, herein designated VGAM GENE, on one or more VGAM2339 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79449] It is yet further appreciated that a function of VGAM2339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2339 correlate with, and may be deduced from, the identity of the host target genes which VGAM2339 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79450] Nucleotide sequences of the VGAM2339 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2339 are further described hereinbelow with reference to Table 1.

[79451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2339 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79452] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2339 gene, herein designated VGAM is inhibition of expression of VGAM2339 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2339 correlate with, and may be deduced from, the identity of the target genes which VGAM2339 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79453] Potassium Inwardly-rectifying Channel, Subfamily J, Member 15 (KCNJ15, Accession NM_002243) is a VGAM2339

host target gene. KCNJ15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNJ15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ15 BINDING SITE, designated SEQ ID:8030, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79454] A function of VGAM2339 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 15 (KCNJ15, Accession NM_002243). Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ15. Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768) is another VGAM2339 host target gene. PEA15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:9846, to the nucleotide sequence of

VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79455] Another function of VGAM2339 is therefore inhibition of Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768), a gene which is a phosphoprotein and involved in glucose uptake. Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15. The function of PEA15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949.Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM_004719) is another VGAM2339 host target gene. SFRS2IP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SFRS2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:11084, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79456] Another function of VGAM2339 is therefore inhibition of

Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM_004719), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP. The function of SFRS2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM700.Surfeit 6 (SURF6, Accession NM_006753) is another VGAM2339 host target gene. SURF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SURF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF6 BINDING SITE, designated SEQ ID:13609, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79457] Another function of VGAM2339 is therefore inhibition of Surfeit 6 (SURF6, Accession NM_006753). Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with SURF6. Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_021988) is another VGAM2339 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:22519, SEQ ID:22766 and SEQ ID:9367 respectively, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79458] Another function of VGAM2339 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_021988), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155.KIAA0217 (Accession XM_040265) is another

VGAM2339 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33275, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79459] Another function of VGAM2339 is therefore inhibition of KIAA0217 (Accession XM_040265). Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. MCF.2 Cell Line Derived Transforming Sequence-like (MCF2L, Accession XM_027516) is another VGAM2339 host target gene. MCF2L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCF2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCF2L BINDING SITE, designated SEQ ID:30507, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5050.

[79460] Another function of VGAM2339 is therefore inhibition of MCF.2 Cell Line Derived Transforming Sequence-like (MCF2L, Accession XM_027516). Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCF2L. LOC116028 (Accession XM_057225) is another VGAM2339 host target gene. LOC116028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC116028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116028 BINDING SITE, designated SEQ ID:36491, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79461] Another function of VGAM2339 is therefore inhibition of LOC116028 (Accession XM_057225). Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116028. LOC149013 (Accession XM_086398) is another VGAM2339 host target gene. LOC149013 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC149013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149013 BINDING SITE, designated SEQ ID:38631, to the nucleotide sequence of VGAM2339 RNA, herein designated VGAM RNA, also designated SEQ ID:5050.

[79462] Another function of VGAM2339 is therefore inhibition of LOC149013 (Accession XM_086398). Accordingly, utilities of VGAM2339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149013. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2340 (VGAM2340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79463] VGAM2340 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2340 was detected is described hereinabove with reference to Figs. 1-8.

[79464] VGAM2340 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine Herpesvirus 2. VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79465] VGAM2340 gene encodes a VGAM2340 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2340 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2340 precursor RNA is designated SEQ ID:2326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2326 is located at position 42263 relative to the genome of Equine Herpesvirus 2.

[79466] VGAM2340 precursor RNA folds onto itself, forming VGAM2340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79467] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2340 folded precursor RNA into VGAM2340 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2340 RNA is designated SEQ ID:5051, and is provided hereinbelow with reference to the sequence listing part.

[79468] VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2340 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79469] VGAM2340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2340 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2340 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79470] The complementary binding of VGAM2340 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2340

host target RNA into VGAM2340 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79471] It is appreciated that VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2340 host target genes. The mRNA of each one of this plurality of VGAM2340 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2340 RNA, herein designated VGAM RNA, and which when bound by VGAM2340 RNA causes inhibition of translation of respective one or more VGAM2340 host target proteins.

[79472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2340 gene, herein designated VGAM GENE, on one or more VGAM2340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79473] It is yet further appreciated that a function of VGAM2340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2340 correlate with, and may be deduced from, the identity of the host target genes which VGAM2340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79474] Nucleotide sequences of the VGAM2340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2340 are further

described hereinbelow with reference to Table 1.

[79475] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2340 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2340 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79476] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2340 gene, herein designated VGAM is inhibition of expression of VGAM2340 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2340 correlate with, and may be deduced from, the identity of the target genes which VGAM2340 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79477] Kallmann Syndrome 1 Sequence (KAL1, Accession NM_000216) is a VGAM2340 host target gene. KAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KAL1 BINDING SITE, designated SEQ ID:5714, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79478] A function of VGAM2340 is therefore inhibition of Kallmann Syndrome 1 Sequence (KAL1, Accession NM_000216). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAL1. Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350) is another VGAM2340 host target gene. PDGFRB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRB BINDING SITE, designated SEQ ID:32816, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79479] Another function of VGAM2340 is therefore inhibition of Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350), a gene which Platelet-derived growth factor receptor beta chain; tyrosine kinase

receptor. Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRB. The function of PDGFRB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.PTPN13-like, Y-linked (PRY, Accession XM_013161) is another VGAM2340 host target gene. PRY BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRY BINDING SITE, designated SEQ ID:30233, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79480] Another function of VGAM2340 is therefore inhibition of PTPN13-like, Y-linked (PRY, Accession XM_013161), a gene which may act as a protein tyrosine phosphatase . Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRY. The function of PRY and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM2280.Wingless-type MMTV Integration Site Family, Member 8B (WNT8B, Accession XM_005702) is another VGAM2340 host target gene. WNT8B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WNT8B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT8B BINDING SITE, designated SEQ ID:29982, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79481] Another function of VGAM2340 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 8B (WNT8B, Accession XM_005702), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors and may play an important role in the development and differentiation of certain forebrain structures. Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT8B. The function of WNT8B and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM636.DKFZP547L112 (Accession XM_039353) is another VGAM2340 host target gene. DKFZP547L112 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP547L112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547L112 BINDING SITE, designated SEQ ID:33054, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79482] Another function of VGAM2340 is therefore inhibition of DKFZP547L112 (Accession XM_039353). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547L112. FLJ20694 (Accession NM_017928) is another VGAM2340 host target gene. FLJ20694 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ20694 BINDING SITE, designated SEQ ID:19604, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79483] Another function of VGAM2340 is therefore inhibition of FLJ20694 (Accession NM_017928). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20694. KIAA1169 (Accession NM_017901) is another VGAM2340 host target gene. KIAA1169 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1169 BINDING SITE, designated SEQ ID:19567, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79484] Another function of VGAM2340 is therefore inhibition of KIAA1169 (Accession NM_017901). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1169. KIAA1817 (Accession XM_042978) is another

VGAM2340 host target gene. KIAA1817 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1817 BINDING SITE, designated SEQ ID:33860, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79485] Another function of VGAM2340 is therefore inhibition of KIAA1817 (Accession XM_042978). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1817. Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054) is another VGAM2340 host target gene. LHFPL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHFPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFPL2 BINDING SITE, designated SEQ ID:34657, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ

ID:5051.

[79486] Another function of VGAM2340 is therefore inhibition of Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFPL2. Nuclear Receptor Subfamily 2, Group F, Member 1 (NR2F1, Accession XM_171117) is another VGAM2340 host target gene. NR2F1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NR2F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2F1 BINDING SITE, designated SEQ ID:45915, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79487] Another function of VGAM2340 is therefore inhibition of Nuclear Receptor Subfamily 2, Group F, Member 1 (NR2F1, Accession XM_171117). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2F1. LOC159160 (Accession XM_018413) is another

VGAM2340 host target gene. LOC159160 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159160 BINDING SITE, designated SEQ ID:30357, to the nucleotide sequence of VGAM2340 RNA, herein designated VGAM RNA, also designated SEQ ID:5051.

[79488] Another function of VGAM2340 is therefore inhibition of LOC159160 (Accession XM_018413). Accordingly, utilities of VGAM2340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159160. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2341 (VGAM2341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79489] VGAM2341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2341 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[79490] VGAM2341 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79491] VGAM2341 gene encodes a VGAM2341 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2341 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2341 precursor RNA is designated SEQ ID:2327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2327 is located at position 38415 relative to the genome of Equine Herpesvirus 2.

[79492] VGAM2341 precursor RNA folds onto itself, forming VGAM2341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79493] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2341 folded precursor RNA into VGAM2341 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2341 RNA is designated SEQ ID:5052, and is provided hereinbelow with reference to the sequence listing part.

[79494] VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2341 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79495] VGAM2341 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2341 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79496] The complementary binding of VGAM2341 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2341 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2341 host target RNA into VGAM2341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79497] It is appreciated that VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2341 host target genes. The mRNA of each one of this plurality of VGAM2341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2341 RNA, herein designated VGAM RNA, and which when bound by VGAM2341 RNA causes inhibition of translation of respective one or more VGAM2341 host target proteins.

[79498] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2341 gene, herein designated VGAM GENE, on one or more VGAM2341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79499] It is yet further appreciated that a function of VGAM2341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2341

correlate with, and may be deduced from, the identity of the host target genes which VGAM2341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79500] Nucleotide sequences of the VGAM2341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2341 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2341 are further described hereinbelow with reference to Table 1.

[79501] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2341 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79502] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2341 gene, herein designated VGAM is inhibition of expression of VGAM2341 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2341 correlate with, and may be deduced

from, the identity of the target genes which VGAM2341 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79503] Adenylate Cyclase 6 (ADCY6, Accession NM_020983) is a VGAM2341 host target gene. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADCY6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:21973 and SEQ ID:17585 respectively, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79504] A function of VGAM2341 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM_020983), a gene which this a membrane-bound, ca(2+)-inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM22.Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM_039627) is another VGAM2341 host target gene. CNTN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN3 BINDING SITE, designated SEQ ID:33134, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79505] Another function of VGAM2341 is therefore inhibition of Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM_039627), a gene which may play a role in the initial growth and guidance of axons. Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN3. The function of CNTN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM420.Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395) is

another VGAM2341 host target gene. DAPP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAPP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPP1 BINDING SITE, designated SEQ ID:15733, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79506] Another function of VGAM2341 is therefore inhibition of Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395), a gene which regulates the ras-cyclic amp pathway. Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPP1. The function of DAPP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM283.Integrin, Alpha 6 (ITGA6, Accession NM_000210) is another VGAM2341 host target gene. ITGA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5705, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79507] Another function of VGAM2341 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM_000210). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. Phosphoenolpyruvate Carboxykinase 1 (soluble) (PCK1, Accession XM_009672) is another VGAM2341 host target gene. PCK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCK1 BINDING SITE, designated SEQ ID:30116, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79508] Another function of VGAM2341 is therefore inhibition of Phosphoenolpyruvate Carboxykinase 1 (soluble) (PCK1,

Accession XM_009672), a gene which forms phosphoenolpyruvate by decarboxylation of oxaloacetate. Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCK1. The function of PCK1 has been established by previous studies. Yu et al. (1993) used primers derived from the rat liver PEPCK sequence to amplify a portion of the human liver cDNA and to screen a YAC library of human genomic DNA. The sequences of human and rat PEPCK cDNA differed at 16% of the nucleotides compared. From the nucleotide sequence of a cDNA, Stoffel et al. (1993) determined that the PEPCK1 gene product is a protein of 622 amino acids whose sequence shows 90% identity with that of the cognate rat enzyme. Animal model experiments lend further support to the function of PCK1. Olswang et al. (2002) found that an induced mutation in the binding site for peroxisome proliferator-activated receptor-gamma (PPARG; 601487), which is called the PPAR element (PPARE), in the Pepckc gene reduced adipose tissue size and fat content in mice. The mutation abolished expression of the Pepckc gene in white adipose tissue and considerably reduced its expression in brown adipose tissue, whereas the level of cytoplasmic Pepckc

mRNA in liver and kidney remained normal. Epididymal white adipose tissue from these mice had a reduced triglyceride deposition, whereas 25% of the animals displayed lipodystrophy. There was also a greatly reduced level of lipid accumulation in brown adipose tissue. A strong correlation between the hepatic content of triglycerides and the size of the epididymal fat pad in PPARE -/- mice suggested that hepatic triglyceride synthesis predominantly utilizes free fatty acids derived from the adipose tissue. Unlike other models, PPARE -/- mice with lipodystrophy did not exhibit the lipodystrophy-associated features of diabetes and displayed only moderate hyperglycemia. These studies established the importance of the PPARE site for PEPCKC gene expression in adipose tissue and the role of PEPCKC in the regulation of glyceroneogenesis, a pathway critical for maintaining the deposition of triglycerides in adipose tissue.

[79509] It is appreciated that the abovementioned animal model for PCK1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[79510] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[79511] Olswang, Y.; Cohen, H.; Papo, O.; Cassuto, H.; Croniger, C. M.; Hakimi, P.; Tilghman, S. M.; Hanson, R. W.; Reshef, L. : A mutation in the peroxisome proliferator-activated receptor gamma-binding site in the gene for the cytosolic form of phosphoenolpyruvate carboxykinase reduces adipose tissue size and fat content in mice. Proc. Nat. Acad. Sci. 99: 625-630, 2002. ; and

[79512] Yu, H.; Thun, R.; Chandrasekharappa, S.; Trent, J. M.; Zhang, J.; Meisler, M. H. : Human PCK1 encoding phosphoenolpyruvate carboxykinase is located on chromosome 20q13.2. Genomics 15: 2.

[79513] Further studies establishing the function and utilities of PCK1 are found in John Hopkins OMIM database record ID 261680, and in sited publications numbered 9409, 9413-941 and 9414-9415 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Thymine-DNA Glycosylase (TDG, Accession NM_003211) is another VGAM2341 host target gene. TDG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TDG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TDG BINDING SITE, designated SEQ ID:9207, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79514] Another function of VGAM2341 is therefore inhibition of Thymine-DNA Glycosylase (TDG, Accession NM_003211), a gene which excises uracil and thymine from mispairs with guanidine. Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDG. The function of TDG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM196.Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM_007136) is another VGAM2341 host target gene. ZNF80 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF80, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF80 BINDING SITE, designated SEQ ID:13984, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79515] Another function of VGAM2341 is therefore inhibition of Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM_007136). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF80. Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM_006995) is another VGAM2341 host target gene. BTN2A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A2 BINDING SITE, designated SEQ ID:13860, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79516] Another function of VGAM2341 is therefore inhibition of Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM_006995). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A2. FLJ20288 (Accession NM_024668) is another VGAM2341 host target gene. FLJ20288 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by FLJ20288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20288 BINDING SITE, designated SEQ ID:23972, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79517] Another function of VGAM2341 is therefore inhibition of FLJ20288 (Accession NM_024668). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20288. KIAA1086 (Accession XM_047610) is another VGAM2341 host target gene. KIAA1086 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1086 BINDING SITE, designated SEQ ID:35010, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79518] Another function of VGAM2341 is therefore inhibition of KIAA1086 (Accession XM_047610). Accordingly, utilities

of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1086. KIAA1600 (Accession XM_049351) is another VGAM2341 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35396, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79519] Another function of VGAM2341 is therefore inhibition of KIAA1600 (Accession XM_049351). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. Phosphodiesterase 3A, CGMP-inhibited (PDE3A, Accession NM_000921) is another VGAM2341 host target gene. PDE3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PDE3A BINDING SITE, designated SEQ ID:6633, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79520] Another function of VGAM2341 is therefore inhibition of Phosphodiesterase 3A, CGMP-inhibited (PDE3A, Accession NM_000921). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE3A. Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144) is another VGAM2341 host target gene. RHOBTB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB1 BINDING SITE, designated SEQ ID:43954, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79521] Another function of VGAM2341 is therefore inhibition of Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RHOBTB1. Ubiquitin Specific Protease 25 (USP25, Accession NM_013396) is another VGAM2341 host target gene. USP25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP25 BINDING SITE, designated SEQ ID:15050, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79522] Another function of VGAM2341 is therefore inhibition of Ubiquitin Specific Protease 25 (USP25, Accession NM_013396). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP25. LOC147077 (Accession XM_085699) is another VGAM2341 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, desig-

nated SEQ ID:38291, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79523] Another function of VGAM2341 is therefore inhibition of LOC147077 (Accession XM_085699). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147077. LOC153077 (Accession XM_098307) is another VGAM2341 host target gene. LOC153077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:41572, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79524] Another function of VGAM2341 is therefore inhibition of LOC153077 (Accession XM_098307). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077. LOC255177 (Accession XM_172941) is another VGAM2341 host target gene. LOC255177 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:46204, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79525] Another function of VGAM2341 is therefore inhibition of LOC255177 (Accession XM_172941). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177. LOC92379 (Accession XM_044712) is another VGAM2341 host target gene. LOC92379 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92379, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92379 BINDING SITE, designated SEQ ID:34269, to the nucleotide sequence of VGAM2341 RNA, herein designated VGAM RNA, also designated SEQ ID:5052.

[79526] Another function of VGAM2341 is therefore inhibition of

LOC92379 (Accession XM_044712). Accordingly, utilities of VGAM2341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92379. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2342 (VGAM2342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79527] VGAM2342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2342 was detected is described hereinabove with reference to Figs. 1-8.

[79528] VGAM2342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79529] VGAM2342 gene encodes a VGAM2342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2342 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2342 precursor RNA is designated SEQ ID:2328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2328 is located at position 43910 relative to the genome of Equine Herpesvirus 2.

[79530] VGAM2342 precursor RNA folds onto itself, forming VGAM2342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79531] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2342 folded precursor RNA into VGAM2342 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM2342 RNA is designated SEQ ID:5053, and is provided hereinbelow with reference to the sequence listing part.

[79532] VGAM2342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2342 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79533] VGAM2342 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2342 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79534] The complementary binding of VGAM2342 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2342 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2342 host target RNA into VGAM2342 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79535] It is appreciated that VGAM2342 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2342 host target genes. The mRNA of each one of this plurality of VGAM2342 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2342 RNA, herein designated VGAM RNA, and which when bound by VGAM2342 RNA causes inhibition of translation of respective one or more VGAM2342 host target proteins.

[79536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2342 gene, herein designated VGAM GENE, on one or more VGAM2342 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79537] It is yet further appreciated that a function of VGAM2342

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2342 correlate with, and may be deduced from, the identity of the host target genes which VGAM2342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79538] Nucleotide sequences of the VGAM2342 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2342 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2342 are further described hereinbelow with reference to Table 1.

[79539] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2342 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2342 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79540] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2342 gene, herein designated VGAM is inhibition of expression of VGAM2342 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2342 correlate with, and may be deduced from, the identity of the target genes which VGAM2342 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79541] Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060) is a VGAM2342 host target gene. ALDH3A2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ALDH3A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3A2 BINDING SITE, designated SEQ ID:34341, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79542] A function of VGAM2342 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ALDH3A2. Mitogen-activated Protein Kinase Kinase Kinase 14 (MAP3K14, Accession NM_003954) is another VGAM2342 host target gene. MAP3K14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K14 BINDING SITE, designated SEQ ID:10092, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79543] Another function of VGAM2342 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 14 (MAP3K14, Accession NM_003954), a gene which is involved in the activation of nf-kappa-b and its transcriptional activity. induces the processing of nf-kappa-b 2/p100. could act in a receptor-selective manner (by similarity). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K14. The function of MAP3K14 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM55.Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804) is another VGAM2342 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:44848, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79544] Another function of VGAM2342 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499) is another VGAM2342 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BINDING SITE,

designated SEQ ID:8315, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79545] Another function of VGAM2342 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329.ADMP (Accession NM_145035) is another VGAM2342 host target gene. ADMP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE, designated SEQ ID:29659, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79546] Another function of VGAM2342 is therefore inhibition of

ADMP (Accession NM_145035). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADMP. Bromodomain Containing 4 (BRD4, Accession NM_058243) is another VGAM2342 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD4 BINDING SITE, designated SEQ ID:27776, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79547] Another function of VGAM2342 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM_058243). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. DKFZP434B205 (Accession XM_059966) is another VGAM2342 host target gene. DKFZP434B205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434B205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B205 BINDING SITE, designated SEQ ID:37126, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79548] Another function of VGAM2342 is therefore inhibition of DKFZP434B205 (Accession XM_059966). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B205. DKFZp547O146 (Accession NM_020224) is another VGAM2342 host target gene. DKFZp547O146 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547O146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547O146 BINDING SITE, designated SEQ ID:21482, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79549] Another function of VGAM2342 is therefore inhibition of DKFZp547O146 (Accession NM_020224). Accordingly, utilities of VGAM2342 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp547O146. FLJ10781 (Accession NM_018215) is another VGAM2342 host target gene. FLJ10781 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE, designated SEQ ID:20135, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79550] Another function of VGAM2342 is therefore inhibition of FLJ10781 (Accession NM_018215). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10781. FLJ12387 (Accession NM_022822) is another VGAM2342 host target gene. FLJ12387 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12387 BINDING SITE, designated SEQ ID:23101, to the nucleotide

sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79551] Another function of VGAM2342 is therefore inhibition of FLJ12387 (Accession NM_022822). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12387. FLJ14810 (Accession NM_032843) is another VGAM2342 host target gene. FLJ14810 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:26633, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79552] Another function of VGAM2342 is therefore inhibition of FLJ14810 (Accession NM_032843). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14810. FLJ22059 (Accession NM_022752) is another VGAM2342 host target gene. FLJ22059 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by FLJ22059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22059 BINDING SITE, designated SEQ ID:22975, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79553] Another function of VGAM2342 is therefore inhibition of FLJ22059 (Accession NM_022752). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22059. FLJ23462 (Accession NM_024843) is another VGAM2342 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24265, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79554] Another function of VGAM2342 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of

VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. HZFW1 (Accession NM_025236) is another VGAM2342 host target gene. HZFW1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HZFW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HZFW1 BINDING SITE, designated SEQ ID:24915, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79555] Another function of VGAM2342 is therefore inhibition of HZFW1 (Accession NM_025236). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HZFW1. KIAA0014 (Accession NM_014665) is another VGAM2342 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE,

designated SEQ ID:16113, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79556] Another function of VGAM2342 is therefore inhibition of KIAA0014 (Accession NM_014665). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014. KIAA0237 (Accession NM_014747) is another VGAM2342 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16445, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79557] Another function of VGAM2342 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0514 (Accession NM_014696) is another VGAM2342 host target gene. KIAA0514 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16206, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79558] Another function of VGAM2342 is therefore inhibition of KIAA0514 (Accession NM_014696). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA0672 (Accession NM_014859) is another VGAM2342 host target gene. KIAA0672 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0672 BINDING SITE, designated SEQ ID:16918, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79559] Another function of VGAM2342 is therefore inhibition of

KIAA0672 (Accession NM_014859). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0672. KIAA1196 (Accession XM_028968) is another VGAM2342 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1196 BINDING SITE, designated SEQ ID:30821, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79560] Another function of VGAM2342 is therefore inhibition of KIAA1196 (Accession XM_028968). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. KIAA1468 (Accession XM_166289) is another VGAM2342 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44098, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79561] Another function of VGAM2342 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. KIAA1762 (Accession XM_033370) is another VGAM2342 host target gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:31911, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79562] Another function of VGAM2342 is therefore inhibition of KIAA1762 (Accession XM_033370). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1762. Leucine-rich Repeat LGI Family, Member 3

(LGI3, Accession NM_139278) is another VGAM2342 host target gene. LGI3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LGI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI3 BINDING SITE, designated SEQ ID:29277, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79563] Another function of VGAM2342 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 3 (LGI3, Accession NM_139278). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI3. MGC13170 (Accession NM_032712) is another VGAM2342 host target gene. MGC13170 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13170 BINDING SITE, designated SEQ ID:26434, to the nucleotide sequence of

VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79564] Another function of VGAM2342 is therefore inhibition of MGC13170 (Accession NM_032712). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13170. RI58 (Accession NM_012420) is another VGAM2342 host target gene. RI58 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RI58, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RI58 BINDING SITE, designated SEQ ID:14795, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79565] Another function of VGAM2342 is therefore inhibition of RI58 (Accession NM_012420). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RI58. SP329 (Accession NM_030793) is another VGAM2342 host target gene. SP329 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by SP329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP329 BINDING SITE, designated SEQ ID:25096, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79566] Another function of VGAM2342 is therefore inhibition of SP329 (Accession NM_030793). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP329. UBCE7IP5 (Accession NM_014948) is another VGAM2342 host target gene. UBCE7IP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBCE7IP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBCE7IP5 BINDING SITE, designated SEQ ID:17270, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79567] Another function of VGAM2342 is therefore inhibition of UBCE7IP5 (Accession NM_014948). Accordingly, utilities of

VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBCE7IP5. LOC123591 (Accession XM_063741) is another VGAM2342 host target gene. LOC123591 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123591 BINDING SITE, designated SEQ ID:37252, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79568] Another function of VGAM2342 is therefore inhibition of LOC123591 (Accession XM_063741). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123591. LOC145371 (Accession XM_085123) is another VGAM2342 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145371 BINDING SITE, designated SEQ ID:37845, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79569] Another function of VGAM2342 is therefore inhibition of LOC145371 (Accession XM_085123). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC149478 (Accession XM_086536) is another VGAM2342 host target gene. LOC149478 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:38752, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79570] Another function of VGAM2342 is therefore inhibition of LOC149478 (Accession XM_086536). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478. LOC152762 (Accession XM_087518) is another VGAM2342 host target gene. LOC152762 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152762 BINDING SITE, designated SEQ ID:39306, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79571] Another function of VGAM2342 is therefore inhibition of LOC152762 (Accession XM_087518). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152762. LOC153516 (Accession NM_138491) is another VGAM2342 host target gene. LOC153516 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153516 BINDING SITE, designated SEQ ID:28841, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79572] Another function of VGAM2342 is therefore inhibition of

LOC153516 (Accession NM_138491). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153516. LOC163412 (Accession XM_088868) is another VGAM2342 host target gene. LOC163412 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163412 BINDING SITE, designated SEQ ID:39952, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79573] Another function of VGAM2342 is therefore inhibition of LOC163412 (Accession XM_088868). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163412. LOC222182 (Accession XM_168471) is another VGAM2342 host target gene. LOC222182 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC222182 BINDING SITE, designated SEQ ID:45196, to the nucleotide sequence of VGAM2342 RNA, herein designated VGAM RNA, also designated SEQ ID:5053.

[79574] Another function of VGAM2342 is therefore inhibition of LOC222182 (Accession XM_168471). Accordingly, utilities of VGAM2342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222182. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2343 (VGAM2343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79575] VGAM2343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2343 was detected is described hereinabove with reference to Figs. 1-8.

[79576] VGAM2343 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[79577] VGAM2343 gene encodes a VGAM2343 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2343 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2343 precursor RNA is designated SEQ ID:2329, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2329 is located at position 43126 relative to the genome of Equine Herpesvirus 2.

[79578] VGAM2343 precursor RNA folds onto itself, forming VGAM2343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79579] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2343 folded precursor RNA into VGAM2343 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2343 RNA is designated SEQ ID:5054, and is provided hereinbelow with reference to the sequence listing part.

[79580] VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2343 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79581] VGAM2343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2343 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79582] The complementary binding of VGAM2343 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2343 host target RNA into VGAM2343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79583] It is appreciated that VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2343 host target genes. The mRNA of each one of this plurality of VGAM2343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2343 RNA, herein designated VGAM RNA, and which when bound by VGAM2343 RNA causes inhibition of translation of respective one or more VGAM2343 host target proteins.

[79584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2343 gene, herein designated VGAM GENE, on one or more VGAM2343 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79585] It is yet further appreciated that a function of VGAM2343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2343 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2343 correlate with, and may be deduced from, the identity of the host target genes which VGAM2343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79586] Nucleotide sequences of the VGAM2343 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2343 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2343 are further described hereinbelow with reference to Table 1.

[79587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2343 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2343 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79588] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2343 gene, herein designated VGAM is inhibition of expression of VGAM2343 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2343 correlate with, and may be deduced from, the identity of the target genes which VGAM2343 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79589] CDT6 (Accession NM_021146) is a VGAM2343 host target gene. CDT6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT6 BINDING SITE, designated SEQ ID:22119, to the nucleotide sequence of VGAM2343 RNA, herein designated VGAM RNA, also designated SEQ ID:5054.

[79590] A function of VGAM2343 is therefore inhibition of CDT6

(Accession NM_021146). Accordingly, utilities of VGAM2343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT6. P114-RHO-GEF (Accession NM_015318) is another VGAM2343 host target gene. P114-RHO-GEF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P114-RHO-GEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P114-RHO-GEF BINDING SITE, designated SEQ ID:17637, to the nucleotide sequence of VGAM2343 RNA, herein designated VGAM RNA, also designated SEQ ID:5054.

[79591] Another function of VGAM2343 is therefore inhibition of P114-RHO-GEF (Accession NM_015318). Accordingly, utilities of VGAM2343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P114-RHO-GEF. ZFD25 (Accession NM_016220) is another VGAM2343 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18321, to the nucleotide sequence of VGAM2343 RNA, herein designated VGAM RNA, also designated SEQ ID:5054.

[79592] Another function of VGAM2343 is therefore inhibition of ZFD25 (Accession NM_016220). Accordingly, utilities of VGAM2343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25. LOC151414 (Accession XM_087197) is another VGAM2343 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151414 BINDING SITE, designated SEQ ID:39107, to the nucleotide sequence of VGAM2343 RNA, herein designated VGAM RNA, also designated SEQ ID:5054.

[79593] Another function of VGAM2343 is therefore inhibition of LOC151414 (Accession XM_087197). Accordingly, utilities of VGAM2343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC151414. LOC90550 (Accession XM_054582) is another VGAM2343 host target gene. LOC90550 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90550 BINDING SITE, designated SEQ ID:36176, to the nucleotide sequence of VGAM2343 RNA, herein designated VGAM RNA, also designated SEQ ID:5054.

[79594] Another function of VGAM2343 is therefore inhibition of LOC90550 (Accession XM_054582). Accordingly, utilities of VGAM2343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90550. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2344 (VGAM2344) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79595] VGAM2344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2344 was detected is described hereinabove with reference to Figs. 1-8.

[79596] VGAM2344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79597] VGAM2344 gene encodes a VGAM2344 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2344 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2344 precursor RNA is designated SEQ ID:2330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2330 is located at position 38540 relative to the genome of Equine Herpesvirus 2.

[79598] VGAM2344 precursor RNA folds onto itself, forming VGAM2344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79599] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2344 folded precursor RNA into VGAM2344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM2344 RNA is designated SEQ ID:5055, and is provided hereinbelow with reference to the sequence listing part.

[79600] VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2344 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79601] VGAM2344 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2344 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2344 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79602] The complementary binding of VGAM2344 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2344 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2344 host target RNA into VGAM2344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79603] It is appreciated that VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2344 host target genes. The mRNA of each one of this plurality of VGAM2344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2344 RNA, herein designated VGAM RNA, and which when bound by VGAM2344 RNA causes inhibition of translation of respective one or more VGAM2344 host target proteins.

[79604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2344 gene, herein designated VGAM GENE, on one or more VGAM2344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79605] It is yet further appreciated that a function of VGAM2344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2344 correlate with, and may be deduced from, the identity of the host target genes which VGAM2344 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79606] Nucleotide sequences of the VGAM2344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2344 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2344 are further described hereinbelow with reference to Table 1.

[79607] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2344 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79608] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2344 gene, herein designated VGAM is inhibition of expression of VGAM2344 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2344 correlate with, and may be deduced from, the identity of the target genes which VGAM2344 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79609] Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395) is a VGAM2344 host target gene. DAPP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by DAPP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPP1 BINDING SITE, designated SEQ ID:15730, to the nucleotide sequence of VGAM2344 RNA, herein designated VGAM RNA, also designated SEQ ID:5055.

[79610] A function of VGAM2344 is therefore inhibition of Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395), a gene which regulates the ras-cyclic amp pathway. Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPP1. The function of DAPP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM283.FLJ23189 (Accession NM_025057) is another VGAM2344 host target gene. FLJ23189 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23189

BINDING SITE, designated SEQ ID:24657, to the nucleotide sequence of VGAM2344 RNA, herein designated VGAM RNA, also designated SEQ ID:5055.

[79611] Another function of VGAM2344 is therefore inhibition of FLJ23189 (Accession NM_025057). Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23189. KIAA0063 (Accession NM_014876) is another VGAM2344 host target gene. KIAA0063 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:17017, to the nucleotide sequence of VGAM2344 RNA, herein designated VGAM RNA, also designated SEQ ID:5055.

[79612] Another function of VGAM2344 is therefore inhibition of KIAA0063 (Accession NM_014876). Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0063. KIAA0802 (Accession XM_031357) is another VGAM2344 host target gene. KIAA0802 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0802 BINDING SITE, designated SEQ ID:31351, to the nucleotide sequence of VGAM2344 RNA, herein designated VGAM RNA, also designated SEQ ID:5055.

[79613] Another function of VGAM2344 is therefore inhibition of KIAA0802 (Accession XM_031357). Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0802. KIAA1560 (Accession XM_034422) is another VGAM2344 host target gene. KIAA1560 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32101, to the nucleotide sequence of VGAM2344 RNA, herein designated VGAM RNA, also designated SEQ ID:5055.

[79614] Another function of VGAM2344 is therefore inhibition of

KIAA1560 (Accession XM_034422). Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1560. Solute Carrier Family 25 (mitochondrial oxodicarboxylate carrier), Member 21 (SLC25A21, Accession NM_030631) is another VGAM2344 host target gene. SLC25A21 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC25A21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A21 BINDING SITE, designated SEQ ID:24967, to the nucleotide sequence of VGAM2344 RNA, herein designated VGAM RNA, also designated SEQ ID:5055.

[79615] Another function of VGAM2344 is therefore inhibition of Solute Carrier Family 25 (mitochondrial oxodicarboxylate carrier), Member 21 (SLC25A21, Accession NM_030631). Accordingly, utilities of VGAM2344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A21. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here

as Viral Genomic Address Messenger 2345 (VGAM2345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79616] VGAM2345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2345 was detected is described hereinabove with reference to Figs. 1-8.

[79617] VGAM2345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79618] VGAM2345 gene encodes a VGAM2345 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2345 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2345 precursor RNA is designated SEQ ID:2331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2331 is located at position 41319 relative to the genome of Equine Herpesvirus 2.

[79619] VGAM2345 precursor RNA folds onto itself, forming VGAM2345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79620] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2345 folded precursor RNA into VGAM2345 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2345 RNA is designated SEQ ID:5056, and is provided hereinbelow with reference to the sequence listing part.

[79621] VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2345 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2345 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79622] VGAM2345 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2345 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2345 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79623] The complementary binding of VGAM2345 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2345 host target RNA into VGAM2345 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79624] It is appreciated that VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2345 host target genes. The mRNA of each one of this plurality of VGAM2345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2345 RNA, herein designated VGAM RNA, and which when bound by VGAM2345 RNA causes inhibition of translation of respective one or more VGAM2345 host target proteins.

[79625] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2345 gene, herein designated VGAM GENE, on one or more VGAM2345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79626] It is yet further appreciated that a function of VGAM2345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2345 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2345 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79627] Nucleotide sequences of the VGAM2345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2345 are further described hereinbelow with reference to Table 1.

[79628] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2345 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79629] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2345 gene, herein designated VGAM is inhibition of expression of VGAM2345 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2345 correlate with, and may be deduced from, the identity of the target genes which VGAM2345

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79630] Ets Variant Gene 3 (ETV3, Accession NM_005240) is a VGAM2345 host target gene. ETV3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ETV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETV3 BINDING SITE, designated SEQ ID:11750, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79631] A function of VGAM2345 is therefore inhibition of Ets Variant Gene 3 (ETV3, Accession NM_005240), a gene which Member of the ETS oncoprotein family. Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETV3. The function of ETV3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791.Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM_003822) is another VGAM2345 host target gene. NR5A2 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NR5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR5A2 BINDING SITE, designated SEQ ID:9912, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79632] Another function of VGAM2345 is therefore inhibition of Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM_003822), a gene which is a member of nuclear receptor superfamily of trancriptional activators and activates the hepatitis B virus (HBV) promoter. Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR5A2. The function of NR5A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM375.Uncoupling Protein 3 (mitochondrial, proton carrier) (UCP3, Accession NM_003356) is another VGAM2345 host target gene. UCP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by UCP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCP3 BINDING SITE, designated SEQ ID:9383, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79633] Another function of VGAM2345 is therefore inhibition of Uncoupling Protein 3 (mitochondrial, proton carrier) (UCP3, Accession NM_003356), a gene which is a mitochondrial transporter protein that creates proton leaks across the inner mitochondrial membrane, thus uncoupling oxidative phosphorylation. Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCP3. The function of UCP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1317.DKFZp762K2015 (Accession XM_051791) is another VGAM2345 host target gene. DKFZp762K2015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp762K2015, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762K2015 BINDING SITE, designated SEQ ID:35884, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79634] Another function of VGAM2345 is therefore inhibition of DKFZp762K2015 (Accession XM_051791). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762K2015. FLJ13340 (Accession NM_057175) is another VGAM2345 host target gene. FLJ13340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13340 BINDING SITE, designated SEQ ID:27703, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79635] Another function of VGAM2345 is therefore inhibition of FLJ13340 (Accession NM_057175). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13340. HTEX4 (Accession XM_166378) is another VGAM2345 host target gene. HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HTEX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3, designated SEQ ID:44215, SEQ ID:46651 and SEQ ID:46720 respectively, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79636] Another function of VGAM2345 is therefore inhibition of HTEX4 (Accession XM_166378). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTEX4. TBDN100 (Accession NM_025085) is another VGAM2345 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24692, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79637] Another function of VGAM2345 is therefore inhibition of TBDN100 (Accession NM_025085). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. TU3A (Accession NM_007177) is another VGAM2345 host target gene. TU3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TU3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU3A BINDING SITE, designated SEQ ID:14031, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79638] Another function of VGAM2345 is therefore inhibition of TU3A (Accession NM_007177). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A. ZNF-U69274 (Accession NM_014415) is another

VGAM2345 host target gene. ZNF-U69274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF-U69274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF-U69274 BINDING SITE, designated SEQ ID:15761, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79639] Another function of VGAM2345 is therefore inhibition of ZNF-U69274 (Accession NM_014415). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF-U69274. LOC201627 (Accession XM_114353) is another VGAM2345 host target gene. LOC201627 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:42893, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79640] Another function of VGAM2345 is therefore inhibition of LOC201627 (Accession XM_114353). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201627. LOC255777 (Accession XM_171342) is another VGAM2345 host target gene. LOC255777 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255777 BINDING SITE, designated SEQ ID:46041, to the nucleotide sequence of VGAM2345 RNA, herein designated VGAM RNA, also designated SEQ ID:5056.

[79641] Another function of VGAM2345 is therefore inhibition of LOC255777 (Accession XM_171342). Accordingly, utilities of VGAM2345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255777. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2346 (VGAM2346) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[79642] VGAM2346 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2346 was detected is described hereinabove with reference to Figs. 1-8.

[79643] VGAM2346 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79644] VGAM2346 gene encodes a VGAM2346 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2346 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2346 precursor RNA is designated SEQ ID:2332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2332 is located at position 38013 relative to the genome of Equine Herpesvirus 2.

[79645] VGAM2346 precursor RNA folds onto itself, forming VGAM2346 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79646] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2346 folded precursor RNA into VGAM2346 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2346 RNA is designated SEQ ID:5057, and is provided hereinbelow with reference to the sequence listing part.

[79647] VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2346 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79648] VGAM2346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2346 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79649] The complementary binding of VGAM2346 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2346 host target RNA into VGAM2346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79650] It is appreciated that VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2346 host target genes. The mRNA of each one of this plurality of VGAM2346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2346 RNA, herein designated VGAM RNA, and which when bound by VGAM2346 RNA causes inhibition of translation of respective one or more VGAM2346 host target proteins.

[79651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2346 gene, herein designated VGAM GENE, on one or more VGAM2346 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79652] It is yet further appreciated that a function of VGAM2346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2346 correlate with, and may be deduced from, the identity of the host target genes which VGAM2346 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[79653] Nucleotide sequences of the VGAM2346 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2346 are further described hereinbelow with reference to Table 1.

[79654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2346 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79655] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2346 gene, herein designated VGAM is inhibition of expression of VGAM2346 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2346 correlate with, and may be deduced from, the identity of the target genes which VGAM2346 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79656] Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286) is a VGAM2346 host target gene. AQP6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AQP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:27616, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79657] A function of VGAM2346 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340.Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174) is another VGAM2346 host target gene. ARHGAP6 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by ARHGAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE, designated SEQ ID:6846, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79658] Another function of VGAM2346 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Chitinase 3-like 1 (cartilage glycoprotein-39) (CHI3L1, Accession NM_001276) is another VGAM2346 host target gene. CHI3L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHI3L1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHI3L1 BINDING SITE, designated SEQ ID:6942, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79659] Another function of VGAM2346 is therefore inhibition of Chitinase 3-like 1 (cartilage glycoprotein-39) (CHI3L1, Accession NM_001276), a gene which participates in the capacity of cells to respond to and cope with changes. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHI3L1. The function of CHI3L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1727.Collagen, Type VI, Alpha 3 (COL6A3, Accession NM_057167) is another VGAM2346 host target gene. COL6A3 BINDING SITE1 and COL6A3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL6A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of COL6A3 BINDING SITE1 and COL6A3 BINDING SITE2, designated SEQ ID:27671 and SEQ ID:10587 respectively, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79660] Another function of VGAM2346 is therefore inhibition of Collagen, Type VI, Alpha 3 (COL6A3, Accession NM_057167). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL6A3. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 20, 103kDa (DDX20, Accession NM_007204) is another VGAM2346 host target gene. DDX20 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDX20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX20 BINDING SITE, designated SEQ ID:14067, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79661] Another function of VGAM2346 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 20,

103kDa (DDX20, Accession NM_007204), a gene which interacts with SMN and is required for pre-mRNA splicing in the nucleus. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX20. The function of DDX20 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Dishevelled, Dsh Homolog 1 (Drosophila) (DVL1, Accession XM_001589) is another VGAM2346 host target gene. DVL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DVL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL1 BINDING SITE, designated SEQ ID:29843, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79662] Another function of VGAM2346 is therefore inhibition of Dishevelled, Dsh Homolog 1 (Drosophila) (DVL1, Accession XM_001589), a gene which may play a role in the signal transduction pathway . Accordingly, utilities of

VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL1. The function of DVL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.Gamma-glutamyltransferase 2 (GGT2, Accession XM_057166) is another VGAM2346 host target gene. GGT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GGT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGT2 BINDING SITE, designated SEQ ID:36490, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79663] Another function of VGAM2346 is therefore inhibition of Gamma-glutamyltransferase 2 (GGT2, Accession XM_057166). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGT2. Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM_002406) is another VGAM2346 host target gene.

MGAT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT1 BINDING SITE, designated SEQ ID:8227, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79664] Another function of VGAM2346 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM_002406), a gene which exists as a single protein-encoding exon. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT1. The function of MGAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM165.Nuclear Receptor Co-repressor 2 (NCOR2, Accession NM_006312) is another VGAM2346 host target gene. NCOR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

NCOR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOR2 BINDING SITE, designated SEQ ID:13004, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79665] Another function of VGAM2346 is therefore inhibition of Nuclear Receptor Co-repressor 2 (NCOR2, Accession NM_006312), a gene which mediates the transcriptional repression activity of some nuclear receptors by promoting chromatin condensation, thus preventing access of the basal transcription. Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOR2. The function of NCOR2 has been established by previous studies. Fischle et al. (2002) showed that the catalytic domain of HDAC4 (OMIM Ref. No. 605314) interacts with HDAC3 (OMIM Ref. No. 605166) via the transcriptional corepressor NCOR2. All experimental conditions leading to the suppression of HDAC4 binding to NCOR2 and to HDAC3 resulted in loss of enzymatic activity associated with HDAC4. These observations indicated that class II HDACs regulate tran-

scription by bridging the enzymatically active NCOR2-HDAC3 complex and select transcription factors.

[79666] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[79667] Fischle, W.; Dequiedt, F.; Hendzel, M. J.; Guenther, M. G.; Lazar, M. A.; Voelter, W.; Verdin, E. : Enzymatic activity associated with class II HDACs is dependent on a multiprotein complex containing HDAC3 and SMRT/N-CoR. Molec. Cell 9: 45-57, 2002. ; and

[79668] Horlein, A. J.; Naar, A. M.; Heinzel, T.; Torchia, J.; Gloss, B.; Kurokawa, R.; Ryan, A.; Kamel, Y.; Soderstrom, M.; Glass, C. K.; Rosenfeld, M. G. : Ligand-independent repression by t.

[79669] Further studies establishing the function and utilities of NCOR2 are found in John Hopkins OMIM database record ID 600848, and in sited publications numbered 9945-9950 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Phosphomannomutase 2 (PMM2, Accession XM_050755) is another VGAM2346 host target gene. PMM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PMM2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMM2 BINDING SITE, designated SEQ ID:35681, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79670] Another function of VGAM2346 is therefore inhibition of Phosphomannomutase 2 (PMM2, Accession XM_050755). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMM2. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558) is another VGAM2346 host target gene. PPP1R8 BINDING SITE1 and PPP1R8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R8 BINDING SITE1 and PPP1R8 BINDING SITE2, designated SEQ ID:28854 and SEQ ID:8568 respectively, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM

RNA, also designated SEQ ID:5057.

[79671] Another function of VGAM2346 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558), a gene which is an inhibitor subunit of the major nuclear protein phosphatase-1 (pp-1). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R8. The function of PPP1R8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM101.Chromosome 20 Open Reading Frame 175 (C20orf175, Accession NM_080829) is another VGAM2346 host target gene. C20orf175 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf175 BINDING SITE, designated SEQ ID:28094, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79672] Another function of VGAM2346 is therefore inhibition of

Chromosome 20 Open Reading Frame 175 (C20orf175, Accession NM_080829). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf175. CUB and Sushi Multiple Domains 1 (CSMD1, Accession NM_033225) is another VGAM2346 host target gene. CSMD1 BINDING SITE1 and CSMD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CSMD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE1 and CSMD1 BINDING SITE2, designated SEQ ID:27069 and SEQ ID:36187 respectively, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79673] Another function of VGAM2346 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession NM_033225). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. DKFZP564B147 (Accession XM_088745) is another VGAM2346 host target gene. DKFZP564B147 BINDING SITE is HOST TARGET bind-

ing site found in the 5` untranslated region of mRNA encoded by DKFZP564B147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B147 BINDING SITE, designated SEQ ID:39935, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79674] Another function of VGAM2346 is therefore inhibition of DKFZP564B147 (Accession XM_088745). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B147. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM2346 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33038, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79675] Another function of VGAM2346 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. FLJ13153 (Accession NM_024786) is another VGAM2346 host target gene. FLJ13153 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13153 BINDING SITE, designated SEQ ID:24166, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79676] Another function of VGAM2346 is therefore inhibition of FLJ13153 (Accession NM_024786). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13153. FLJ14621 (Accession NM_032811) is another VGAM2346 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14621, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26580, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79677] Another function of VGAM2346 is therefore inhibition of FLJ14621 (Accession NM_032811). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. FLJ20752 (Accession NM_019048) is another VGAM2346 host target gene. FLJ20752 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20752 BINDING SITE, designated SEQ ID:21129, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79678] Another function of VGAM2346 is therefore inhibition of FLJ20752 (Accession NM_019048). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20752. FLJ21709 (Accession XM_085480) is another VGAM2346 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38172, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79679] Another function of VGAM2346 is therefore inhibition of FLJ21709 (Accession XM_085480). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. FLJ22477 (Accession NM_024735) is another VGAM2346 host target gene. FLJ22477 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22477 BINDING SITE, designated SEQ ID:24075, to the nucleotide

sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79680] Another function of VGAM2346 is therefore inhibition of FLJ22477 (Accession NM_024735). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22477. FLJ32865 (Accession NM_144613) is another VGAM2346 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29429, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79681] Another function of VGAM2346 is therefore inhibition of FLJ32865 (Accession NM_144613). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865. HGC6.1.1 (Accession NM_014354) is another VGAM2346 host target gene. HGC6.1.1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by HGC6.1.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGC6.1.1 BINDING SITE, designated SEQ ID:15685, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79682] Another function of VGAM2346 is therefore inhibition of HGC6.1.1 (Accession NM_014354). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGC6.1.1. KIAA0010 (Accession NM_014671) is another VGAM2346 host target gene. KIAA0010 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0010 BINDING SITE, designated SEQ ID:16131, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79683] Another function of VGAM2346 is therefore inhibition of KIAA0010 (Accession NM_014671). Accordingly, utilities

of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0010. KIAA1881 (Accession XM_170901) is another VGAM2346 host target gene. KIAA1881 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1881 BINDING SITE, designated SEQ ID:45657, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79684] Another function of VGAM2346 is therefore inhibition of KIAA1881 (Accession XM_170901). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1881. MGC20486 (Accession NM_052844) is another VGAM2346 host target gene. MGC20486 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC20486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC20486 BINDING SITE, designated SEQ ID:27422, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79685] Another function of VGAM2346 is therefore inhibition of MGC20486 (Accession NM_052844). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20486. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM2346 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30685, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79686] Another function of VGAM2346 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8.

ZD52F10 (Accession NM_033317) is another VGAM2346 host target gene. ZD52F10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZD52F10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZD52F10 BINDING SITE, designated SEQ ID:27155, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79687] Another function of VGAM2346 is therefore inhibition of ZD52F10 (Accession NM_033317). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZD52F10. LOC150538 (Accession XM_086945) is another VGAM2346 host target gene. LOC150538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150538 BINDING SITE, designated SEQ ID:38992, to the nucleotide sequence of VGAM2346 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5057.

[79688] Another function of VGAM2346 is therefore inhibition of LOC150538 (Accession XM_086945). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150538. LOC157740 (Accession XM_088375) is another VGAM2346 host target gene. LOC157740 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157740, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157740 BINDING SITE, designated SEQ ID:39648, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79689] Another function of VGAM2346 is therefore inhibition of LOC157740 (Accession XM_088375). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157740. LOC158117 (Accession XM_088483) is another VGAM2346 host target gene. LOC158117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158117, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158117 BINDING SITE, designated SEQ ID:39729, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79690] Another function of VGAM2346 is therefore inhibition of LOC158117 (Accession XM_088483). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158117. LOC158972 (Accession XM_099009) is another VGAM2346 host target gene. LOC158972 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158972 BINDING SITE, designated SEQ ID:42043, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79691] Another function of VGAM2346 is therefore inhibition of LOC158972 (Accession XM_099009). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158972. LOC203275 (Accession XM_114667) is another VGAM2346 host target gene. LOC203275 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203275 BINDING SITE, designated SEQ ID:43027, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79692] Another function of VGAM2346 is therefore inhibition of LOC203275 (Accession XM_114667). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203275. LOC219513 (Accession XM_169166) is another VGAM2346 host target gene. LOC219513 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45293, to

the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79693] Another function of VGAM2346 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. LOC221271 (Accession XM_166307) is another VGAM2346 host target gene. LOC221271 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:44124, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79694] Another function of VGAM2346 is therefore inhibition of LOC221271 (Accession XM_166307). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271. LOC256812 (Accession XM_174147) is another VGAM2346 host target gene. LOC256812 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC256812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256812 BINDING SITE, designated SEQ ID:46579, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79695] Another function of VGAM2346 is therefore inhibition of LOC256812 (Accession XM_174147). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256812. LOC257422 (Accession XM_172923) is another VGAM2346 host target gene. LOC257422 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257422 BINDING SITE, designated SEQ ID:46190, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79696] Another function of VGAM2346 is therefore inhibition of LOC257422 (Accession XM_172923). Accordingly, utilities

of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257422. LOC57228 (Accession NM_020467) is another VGAM2346 host target gene. LOC57228 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC57228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57228 BINDING SITE, designated SEQ ID:21706, to the nucleotide sequence of VGAM2346 RNA, herein designated VGAM RNA, also designated SEQ ID:5057.

[79697] Another function of VGAM2346 is therefore inhibition of LOC57228 (Accession NM_020467). Accordingly, utilities of VGAM2346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57228. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2347 (VGAM2347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79698] VGAM2347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2347 was detected is described hereinabove with reference to Figs. 1-8.

[79699] VGAM2347 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79700] VGAM2347 gene encodes a VGAM2347 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2347 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2347 precursor RNA is designated SEQ ID:2333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2333 is located at position 44095 relative to the genome of Equine Herpesvirus 2.

[79701] VGAM2347 precursor RNA folds onto itself, forming VGAM2347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79702] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2347 folded precursor RNA into VGAM2347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2347 RNA is designated SEQ ID:5058, and is provided hereinbelow with reference to the sequence listing part.

[79703] VGAM2347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2347 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[79704] VGAM2347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2347 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79705] The complementary binding of VGAM2347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2347 host target RNA into VGAM2347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79706] It is appreciated that VGAM2347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2347 host target genes. The mRNA of each one of this plurality of VGAM2347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2347 RNA, herein designated VGAM RNA, and which when bound by VGAM2347 RNA causes inhibition of translation of respective one or more VGAM2347 host target proteins.

[79707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2347 gene, herein designated VGAM GENE, on one or more VGAM2347 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79708] It is yet further appreciated that a function of VGAM2347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2347 correlate with, and may be deduced from, the identity of the host target genes which VGAM2347 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79709] Nucleotide sequences of the VGAM2347 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2347 are further described hereinbelow with reference to Table 1.

[79710] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2347 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2347 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79711] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2347 gene, herein designated VGAM is inhibition of expression of VGAM2347 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2347 correlate with, and may be deduced from, the identity of the target genes which VGAM2347 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79712] Casein Kinase 1, Alpha 1 (CSNK1A1, Accession NM_001892) is a VGAM2347 host target gene. CSNK1A1

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSNK1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1A1 BINDING SITE, designated SEQ ID:7620, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79713] A function of VGAM2347 is therefore inhibition of Casein Kinase 1, Alpha 1 (CSNK1A1, Accession NM_001892). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1A1. MAP-kinase Activating Death Domain (MADD, Accession NM_003682) is another VGAM2347 host target gene. MADD BINDING SITE1 through MADD BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MADD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADD BINDING SITE1 through MADD BINDING SITE6, designated SEQ ID:9788, SEQ ID:28237, SEQ

ID:28243, SEQ ID:28248, SEQ ID:28253 and SEQ ID:28258 respectively, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79714] Another function of VGAM2347 is therefore inhibition of MAP-kinase Activating Death Domain (MADD, Accession NM_003682), a gene which may regulate two different pathways for neural activities.interacts with the type-1 tumor necrosis factor receptor (TNFR1); death domain-containing protein. Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADD. The function of MADD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.CMRF-35H (Accession XM_046925) is another VGAM2347 host target gene. CMRF-35H BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CMRF-35H, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMRF-35H BINDING SITE, designated SEQ ID:34861, to the nu-

cleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79715] Another function of VGAM2347 is therefore inhibition of CMRF-35H (Accession XM_046925). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMRF-35H. CCR4-NOT Transcription Complex, Subunit 3 (CNOT3, Accession NM_014516) is another VGAM2347 host target gene. CNOT3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CNOT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT3 BINDING SITE, designated SEQ ID:15843, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79716] Another function of VGAM2347 is therefore inhibition of CCR4-NOT Transcription Complex, Subunit 3 (CNOT3, Accession NM_014516). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT3. DKFZP564D172 (Accession NM_032042) is another

VGAM2347 host target gene. DKFZP564D172 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D172 BINDING SITE, designated SEQ ID:25753, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79717] Another function of VGAM2347 is therefore inhibition of DKFZP564D172 (Accession NM_032042). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D172. FLJ14327 (Accession NM_024912) is another VGAM2347 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24430, to the nucleotide sequence of VGAM2347 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5058.

[79718] Another function of VGAM2347 is therefore inhibition of FLJ14327 (Accession NM_024912). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. FLJ22233 (Accession NM_024959) is another VGAM2347 host target gene. FLJ22233 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22233 BINDING SITE, designated SEQ ID:24514, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79719] Another function of VGAM2347 is therefore inhibition of FLJ22233 (Accession NM_024959). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22233. NEU4 (Accession NM_080741) is another VGAM2347 host target gene. NEU4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NEU4, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU4 BINDING SITE, designated SEQ ID:28028, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79720] Another function of VGAM2347 is therefore inhibition of NEU4 (Accession NM_080741). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU4. LOC112868 (Accession XM_053402) is another VGAM2347 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36079, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79721] Another function of VGAM2347 is therefore inhibition of LOC112868 (Accession XM_053402). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC112868. LOC151826 (Accession XM_087312) is another VGAM2347 host target gene. LOC151826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151826 BINDING SITE, designated SEQ ID:39165, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79722] Another function of VGAM2347 is therefore inhibition of LOC151826 (Accession XM_087312). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151826. LOC152313 (Accession XM_098190) is another VGAM2347 host target gene. LOC152313 BINDING SITE1 and LOC152313 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC152313, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE1

and LOC152313 BINDING SITE2, designated SEQ ID:41478 and SEQ ID:41479 respectively, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79723] Another function of VGAM2347 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC92568 (Accession XM_045852) is another VGAM2347 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34580, to the nucleotide sequence of VGAM2347 RNA, herein designated VGAM RNA, also designated SEQ ID:5058.

[79724] Another function of VGAM2347 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM2347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2348 (VGAM2348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79725] VGAM2348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2348 was detected is described hereinabove with reference to Figs. 1-8.

[79726] VGAM2348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79727] VGAM2348 gene encodes a VGAM2348 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2348 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2348 precursor RNA is designated SEQ ID:2334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2334 is located at position 16485 relative to the genome of Equine Herpesvirus 2.

[79728] VGAM2348 precursor RNA folds onto itself, forming VGAM2348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79729] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2348 folded precursor RNA into VGAM2348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2348 RNA is designated SEQ ID:5059, and is provided hereinbelow with reference to the sequence listing part.

[79730] VGAM2348 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2348 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79731] VGAM2348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2348 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2348 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79732] The complementary binding of VGAM2348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2348 host target RNA into VGAM2348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79733] It is appreciated that VGAM2348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2348 host target genes. The mRNA of each one of this plurality of VGAM2348 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2348 RNA, herein designated VGAM RNA, and which when bound by VGAM2348 RNA causes inhibition of translation of respective one or more

VGAM2348 host target proteins.

[79734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2348 gene, herein designated VGAM GENE, on one or more VGAM2348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79735] It is yet further appreciated that a function of VGAM2348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM2348 correlate with, and may be deduced from, the identity of the host target genes which VGAM2348 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79736] Nucleotide sequences of the VGAM2348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2348 are further described hereinbelow with reference to Table 1.

[79737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2348 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2348 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2348 gene, herein designated VGAM is inhibition of expression of VGAM2348 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2348 correlate with, and may be deduced from, the identity of the target genes which VGAM2348 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79739] Isocitrate Dehydrogenase 1 (NADP+), Soluble (IDH1, Accession XM_028869) is a VGAM2348 host target gene. IDH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDH1 BINDING SITE, designated SEQ ID:30800, to the nucleotide sequence of VGAM2348 RNA, herein designated VGAM RNA, also designated SEQ ID:5059.

[79740] A function of VGAM2348 is therefore inhibition of Isocitrate Dehydrogenase 1 (NADP+), Soluble (IDH1, Accession XM_028869), a gene which decarboxylates isocitrate into alpha-ketoglutarate. Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDH1. The function of IDH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1928.FLJ20060 (Accession NM_017645) is another VGAM2348 host target gene. FLJ20060 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20060 BINDING SITE, designated SEQ ID:19150, to the nucleotide sequence of VGAM2348 RNA, herein designated VGAM RNA, also designated SEQ ID:5059.

[79741] Another function of VGAM2348 is therefore inhibition of FLJ20060 (Accession NM_017645). Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20060. Growth Hormone Inducible Transmembrane Protein (GHITM, Accession NM_014394) is another VGAM2348 host target gene. GHITM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GHITM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GHITM BINDING SITE, designated SEQ ID:15727, to the nucleotide sequence of

VGAM2348 RNA, herein designated VGAM RNA, also designated SEQ ID:5059.

[79742] Another function of VGAM2348 is therefore inhibition of Growth Hormone Inducible Transmembrane Protein (GHITM, Accession NM_014394). Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHITM. Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485) is another VGAM2348 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:10812, to the nucleotide sequence of VGAM2348 RNA, herein designated VGAM RNA, also designated SEQ ID:5059.

[79743] Another function of VGAM2348 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485). Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4.

KIAA1228 (Accession XM_036408) is another VGAM2348 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:32447, to the nucleotide sequence of VGAM2348 RNA, herein designated VGAM RNA, also designated SEQ ID:5059.

[79744] Another function of VGAM2348 is therefore inhibition of KIAA1228 (Accession XM_036408). Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. KIAA1361 (Accession XM_030845) is another VGAM2348 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31166, to the nucleotide sequence of VGAM2348 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5059.

[79745] Another function of VGAM2348 is therefore inhibition of KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. LOC222001 (Accession XM_167489) is another VGAM2348 host target gene. LOC222001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222001 BINDING SITE, designated SEQ ID:44641, to the nucleotide sequence of VGAM2348 RNA, herein designated VGAM RNA, also designated SEQ ID:5059.

[79746] Another function of VGAM2348 is therefore inhibition of LOC222001 (Accession XM_167489). Accordingly, utilities of VGAM2348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222001. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2349 (VGAM2349) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79747] VGAM2349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2349 was detected is described hereinabove with reference to Figs. 1-8.

[79748] VGAM2349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2349 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79749] VGAM2349 gene encodes a VGAM2349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2349 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2349 precursor RNA is designated SEQ ID:2335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2335 is located at position 19286 relative to the genome of Equine Herpesvirus 2.

[79750] VGAM2349 precursor RNA folds onto itself, forming

VGAM2349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79751] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2349 folded precursor RNA into VGAM2349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2349 RNA is designated SEQ ID:5060, and is provided hereinbelow with reference to the sequence listing part.

[79752] VGAM2349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2349 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79753] VGAM2349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2349 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79754] The complementary binding of VGAM2349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2349 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2349 host target RNA into VGAM2349 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79755] It is appreciated that VGAM2349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2349 host target genes. The mRNA of each one of this plurality of VGAM2349 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2349 RNA, herein designated VGAM RNA, and which when bound by VGAM2349 RNA causes inhibition of translation of respective one or more VGAM2349 host target proteins.

[79756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2349 gene, herein designated VGAM GENE, on one or more VGAM2349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79757] It is yet further appreciated that a function of VGAM2349 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2349 correlate with, and may be deduced from, the identity of the host target genes which VGAM2349 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[79758] Nucleotide sequences of the VGAM2349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2349 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2349 are further described hereinbelow with reference to Table 1.

[79759] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2349 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79760] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2349 gene, herein designated VGAM is inhibition of expression of VGAM2349 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2349 correlate with, and may be deduced from, the identity of the target genes which VGAM2349 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[79761] ATP-binding Cassette, Sub-family D (ALD), Member 1 (ABCD1, Accession NM_000033) is a VGAM2349 host target gene. ABCD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABCD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD1 BINDING SITE, designated SEQ ID:5471, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79762] A function of VGAM2349 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 1 (ABCD1, Accession NM_000033). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD1. Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774) is another VGAM2349 host target gene. ANK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30286, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79763] Another function of VGAM2349 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. AXL Receptor Tyrosine Kinase (AXL, Accession NM_021913) is another VGAM2349 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:22444 and SEQ ID:7423 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79764] Another function of VGAM2349 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM_021913). Accordingly, utilities of VGAM2349 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080681) is another VGAM2349 host target gene. COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL11A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2, designated SEQ ID:27981 and SEQ ID:35917 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79765] Another function of VGAM2349 is therefore inhibition of Collagen, Type XI, Alpha 2 (COL11A2, Accession NM_080681). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2. Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398) is another VGAM2349 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DLG5, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40338, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79766] Another function of VGAM2349 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444.Fibroblast Growth Factor Receptor-like 1 (FGFRL1, Accession NM_021923) is another VGAM2349 host target gene. FGFRL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGFRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFRL1 BINDING SITE, des-

ignated SEQ ID:22450, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79767] Another function of VGAM2349 is therefore inhibition of Fibroblast Growth Factor Receptor-like 1 (FGFRL1, Accession NM_021923). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFRL1. General Transcription Factor II, I (GTF2I, Accession NM_032999) is another VGAM2349 host target gene. GTF2I BINDING SITE1 and GTF2I BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GTF2I, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2I BINDING SITE1 and GTF2I BINDING SITE2, designated SEQ ID:26886 and SEQ ID:26890 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79768] Another function of VGAM2349 is therefore inhibition of General Transcription Factor II, I (GTF2I, Accession NM_032999), a gene which interacts with the basal tran-

scription machinery by coordinating the formation of a multiprotein complex at the c-fos promoter, and linking specific signal responsive activator complexes. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2I. The function of GTF2I and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115.Homeo Box D3 (HOXD3, Accession NM_006898) is another VGAM2349 host target gene. HOXD3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HOXD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD3 BINDING SITE, designated SEQ ID:13773, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79769] Another function of VGAM2349 is therefore inhibition of Homeo Box D3 (HOXD3, Accession NM_006898), a gene which plays a role in the differentiation process of hematopoietic cells. Accordingly, utilities of VGAM2349

include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD3. The function of HOXD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1384.Kinesin Family Member 3C (KIF3C, Accession NM_002254) is another VGAM2349 host target gene. KIF3C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIF3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3C BINDING SITE, designated SEQ ID:8059, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79770] Another function of VGAM2349 is therefore inhibition of Kinesin Family Member 3C (KIF3C, Accession NM_002254). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3C. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 7 (MLLT7, Accession NM_005938) is another VGAM2349 host target gene.

MLLT7 BINDING SITE1 and MLLT7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MLLT7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT7 BINDING SITE1 and MLLT7 BINDING SITE2, designated SEQ ID:12576 and SEQ ID:12577 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79771] Another function of VGAM2349 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 7 (MLLT7, Accession NM_005938), a gene which is a Member of the forkhead family. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT7. The function of MLLT7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175.Mevalonate Kinase (mevalonic aciduria) (MVK, Accession XM_027151) is another VGAM2349 host target gene. MVK BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by MVK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MVK BINDING SITE, designated SEQ ID:30426, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79772] Another function of VGAM2349 is therefore inhibition of Mevalonate Kinase (mevalonic aciduria) (MVK, Accession XM_027151). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MVK. Myosin Light Chain Kinase 2, Skeletal Muscle (MYLK2, Accession NM_033118) is another VGAM2349 host target gene. MYLK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYLK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYLK2 BINDING SITE, designated SEQ ID:26965, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79773] Another function of VGAM2349 is therefore inhibition of

Myosin Light Chain Kinase 2, Skeletal Muscle (MYLK2, Accession NM_033118). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK2. Myosin XVA (MYO15A, Accession NM_016239) is another VGAM2349 host target gene. MYO15A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYO15A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO15A BINDING SITE, designated SEQ ID:18354, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79774] Another function of VGAM2349 is therefore inhibition of Myosin XVA (MYO15A, Accession NM_016239), a gene which acts as actin-based motors. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO15A. The function of MYO15A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM985.Neuro-oncological Ventral

Antigen 1 (NOVA1, Accession NM_006489) is another VGAM2349 host target gene. NOVA1 BINDING SITE1 and NOVA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NOVA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOVA1 BINDING SITE1 and NOVA1 BINDING SITE2, designated SEQ ID:13216 and SEQ ID:8347 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79775] Another function of VGAM2349 is therefore inhibition of Neuro-oncological Ventral Antigen 1 (NOVA1, Accession NM_006489), a gene which may regulate rna splicing or metabolism in a specific subset of developing neurons. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOVA1. The function of NOVA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM521.PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_033018) is an-

other VGAM2349 host target gene. PCTK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK1 BINDING SITE, designated SEQ ID:26910, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79776] Another function of VGAM2349 is therefore inhibition of PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_033018), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTK1. The function of PCTK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75.Polymeric Immunoglobulin Receptor (PIGR, Accession XM_052013) is another VGAM2349 host target gene. PIGR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIGR, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:35939, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79777] Another function of VGAM2349 is therefore inhibition of Polymeric Immunoglobulin Receptor (PIGR, Accession XM_052013). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGR. Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020630) is another VGAM2349 host target gene. RET BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE, designated SEQ ID:21784, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79778] Another function of VGAM2349 is therefore inhibition of

Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020630), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RET. The function of RET and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.Ret Finger Protein (RFP, Accession NM_006510) is another VGAM2349 host target gene. RFP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFP BINDING SITE, designated SEQ ID:13259, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79779] Another function of VGAM2349 is therefore inhibition of Ret Finger Protein (RFP, Accession NM_006510), a gene which involvels in transcriptional regulation and may act in male germ cell development . Accordingly, utilities of

VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFP. The function of RFP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302.Seizure Related 6 Homolog (mouse)-like (SEZ6L, Accession NM_021115) is another VGAM2349 host target gene. SEZ6L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEZ6L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6L BINDING SITE, designated SEQ ID:22093, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79780] Another function of VGAM2349 is therefore inhibition of Seizure Related 6 Homolog (mouse)-like (SEZ6L, Accession NM_021115). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6L. Small Glutamine-rich Tetratricopeptide Repeat (TPR)-containing (SGT, Accession NM_003021) is another VGAM2349 host

target gene. SGT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGT BINDING SITE, designated SEQ ID:8941, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79781] Another function of VGAM2349 is therefore inhibition of Small Glutamine-rich Tetratricopeptide Repeat (TPR)-containing (SGT, Accession NM_003021). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGT. Testis Enhanced Gene Transcript (BAX inhibitor 1) (TEGT, Accession XM_035490) is another VGAM2349 host target gene. TEGT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEGT BINDING SITE, designated SEQ ID:32273, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5060.

[79782] Another function of VGAM2349 is therefore inhibition of Testis Enhanced Gene Transcript (BAX inhibitor 1) (TEGT, Accession XM_035490), a gene which is a suppressor of apoptosis. Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEGT. The function of TEGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2276.Tensin (TNS, Accession NM_022648) is another VGAM2349 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22902, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79783] Another function of VGAM2349 is therefore inhibition of Tensin (TNS, Accession NM_022648). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with TNS. Topoisomerase (DNA) III Beta (TOP3B, Accession NM_003935) is another VGAM2349 host target gene. TOP3B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TOP3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOP3B BINDING SITE, designated SEQ ID:10037, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79784] Another function of VGAM2349 is therefore inhibition of Topoisomerase (DNA) III Beta (TOP3B, Accession NM_003935). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOP3B. Activating Transcription Factor 3 (ATF3, Accession NM_004024) is another VGAM2349 host target gene. ATF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:10244, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79785] Another function of VGAM2349 is therefore inhibition of Activating Transcription Factor 3 (ATF3, Accession NM_004024). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3. Chromosome 20 Open Reading Frame 178 (C20orf178, Accession XM_059282) is another VGAM2349 host target gene. C20orf178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf178 BINDING SITE, designated SEQ ID:36935, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79786] Another function of VGAM2349 is therefore inhibition of Chromosome 20 Open Reading Frame 178 (C20orf178, Accession XM_059282). Accordingly, utilities of

VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf178. Casein Kinase 1, Gamma 1 (CSNK1G1, Accession NM_022048) is another VGAM2349 host target gene. CSNK1G1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSNK1G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1G1 BINDING SITE, designated SEQ ID:22569, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79787] Another function of VGAM2349 is therefore inhibition of Casein Kinase 1, Gamma 1 (CSNK1G1, Accession NM_022048). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G1. CSR1 (Accession NM_016240) is another VGAM2349 host target gene. CSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CSR1 BINDING SITE, designated SEQ ID:18359, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79788] Another function of VGAM2349 is therefore inhibition of CSR1 (Accession NM_016240). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSR1. Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384) is another VGAM2349 host target gene. DGKD BINDING SITE1 and DGKD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DGKD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE1 and DGKD BINDING SITE2, designated SEQ ID:29885 and SEQ ID:29886 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79789] Another function of VGAM2349 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM_002384). Accordingly, utilities of VGAM2349 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. DKFZP564O0423 (Accession XM_166254) is another VGAM2349 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44067, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79790] Another function of VGAM2349 is therefore inhibition of DKFZP564O0423 (Accession XM_166254). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. DKFZP761D0211 (Accession NM_032039) is another VGAM2349 host target gene. DKFZP761D0211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761D0211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP761D0211 BINDING SITE, designated SEQ ID:25736, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79791] Another function of VGAM2349 is therefore inhibition of DKFZP761D0211 (Accession NM_032039). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761D0211. FLJ10597 (Accession NM_018150) is another VGAM2349 host target gene. FLJ10597 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10597 BINDING SITE, designated SEQ ID:19953, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79792] Another function of VGAM2349 is therefore inhibition of FLJ10597 (Accession NM_018150). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10597. FLJ10661 (Accession NM_018172) is another

VGAM2349 host target gene. FLJ10661 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10661 BINDING SITE, designated SEQ ID:19997, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79793] Another function of VGAM2349 is therefore inhibition of FLJ10661 (Accession NM_018172). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10661. FLJ21276 (Accession NM_024633) is another VGAM2349 host target gene. FLJ21276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:23902, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79794] Another function of VGAM2349 is therefore inhibition of FLJ21276 (Accession NM_024633). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM2349 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:28921 and SEQ ID:17400 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79795] Another function of VGAM2349 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. H326 (Accession NM_015726) is another

VGAM2349 host target gene. H326 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by H326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H326 BINDING SITE, designated SEQ ID:17939, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79796] Another function of VGAM2349 is therefore inhibition of H326 (Accession NM_015726). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H326. KIAA0153 (Accession NM_015140) is another VGAM2349 host target gene. KIAA0153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0153 BINDING SITE, designated SEQ ID:17498, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79797] Another function of VGAM2349 is therefore inhibition of KIAA0153 (Accession NM_015140). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0153. KIAA0527 (Accession XM_171054) is another VGAM2349 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45843, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79798] Another function of VGAM2349 is therefore inhibition of KIAA0527 (Accession XM_171054). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA0819 (Accession XM_032996) is another VGAM2349 host target gene. KIAA0819 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0819, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0819 BINDING SITE, designated SEQ ID:31808, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79799] Another function of VGAM2349 is therefore inhibition of KIAA0819 (Accession XM_032996). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0819. KIAA1110 (Accession XM_029973) is another VGAM2349 host target gene. KIAA1110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:30985, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79800] Another function of VGAM2349 is therefore inhibition of KIAA1110 (Accession XM_029973). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1110. KIAA1228 (Accession XM_036408) is another VGAM2349 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:32445, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79801] Another function of VGAM2349 is therefore inhibition of KIAA1228 (Accession XM_036408). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. KIAA1538 (Accession XM_049474) is another VGAM2349 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35430, to the nucleotide sequence of VGAM2349 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5060.

[79802] Another function of VGAM2349 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1559 (Accession XM_054472) is another VGAM2349 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36163, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79803] Another function of VGAM2349 is therefore inhibition of KIAA1559 (Accession XM_054472). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. KIAA1751 (Accession XM_049768) is another VGAM2349 host target gene. KIAA1751 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1751, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1751 BINDING SITE, designated SEQ ID:35497, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79804] Another function of VGAM2349 is therefore inhibition of KIAA1751 (Accession XM_049768). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1751. KIAA1755 (Accession XM_028810) is another VGAM2349 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30751, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79805] Another function of VGAM2349 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1755. KIAA1784 (Accession XM_036660) is another VGAM2349 host target gene. KIAA1784 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1784 BINDING SITE, designated SEQ ID:32485, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79806] Another function of VGAM2349 is therefore inhibition of KIAA1784 (Accession XM_036660). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1784. KIAA1870 (Accession NM_032888) is another VGAM2349 host target gene. KIAA1870 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1870 BINDING SITE, designated SEQ ID:26710, to the

nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79807] Another function of VGAM2349 is therefore inhibition of KIAA1870 (Accession NM_032888). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1870. KIAA1957 (Accession XM_065166) is another VGAM2349 host target gene. KIAA1957 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1957 BINDING SITE, designated SEQ ID:37277, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79808] Another function of VGAM2349 is therefore inhibition of KIAA1957 (Accession XM_065166). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1957. MGC16279 (Accession NM_032916) is another VGAM2349 host target gene. MGC16279 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by MGC16279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16279 BINDING SITE, designated SEQ ID:26732, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79809] Another function of VGAM2349 is therefore inhibition of MGC16279 (Accession NM_032916). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16279. MGC33182 (Accession XM_062903) is another VGAM2349 host target gene. MGC33182 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC33182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC33182 BINDING SITE, designated SEQ ID:37233, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79810] Another function of VGAM2349 is therefore inhibition of MGC33182 (Accession XM_062903). Accordingly, utilities

of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33182. MGC4415 (Accession NM_031484) is another VGAM2349 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25568, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79811] Another function of VGAM2349 is therefore inhibition of MGC4415 (Accession NM_031484). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. MGC4677 (Accession NM_052871) is another VGAM2349 host target gene. MGC4677 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4677

BINDING SITE, designated SEQ ID:27452, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79812] Another function of VGAM2349 is therefore inhibition of MGC4677 (Accession NM_052871). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4677. Myelin Transcription Factor 1-like (MYT1L, Accession XM_039762) is another VGAM2349 host target gene. MYT1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MYT1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYT1L BINDING SITE, designated SEQ ID:33185, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79813] Another function of VGAM2349 is therefore inhibition of Myelin Transcription Factor 1-like (MYT1L, Accession XM_039762). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYT1L. Phosphatidylinosi-

tol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_003559) is another VGAM2349 host target gene. PIP5K2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:9613, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79814] Another function of VGAM2349 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_003559). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B. Phospholipase A2, Group VI (cytosolic, calcium-independent) (PLA2G6, Accession XM_039248) is another VGAM2349 host target gene. PLA2G6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLA2G6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PLA2G6 BINDING SITE, designated SEQ ID:33031, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79815] Another function of VGAM2349 is therefore inhibition of Phospholipase A2, Group VI (cytosolic, calcium-independent) (PLA2G6, Accession XM_039248). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G6. Sodium Channel, Voltage-gated, Type XII, Alpha Polypeptide (SCN12A, Accession NM_014139) is another VGAM2349 host target gene. SCN12A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN12A BINDING SITE, designated SEQ ID:15411, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79816] Another function of VGAM2349 is therefore inhibition of Sodium Channel, Voltage-gated, Type XII, Alpha Polypeptide (SCN12A, Accession NM_014139). Accordingly, utili-

ties of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN12A. Stathmin-like 3 (STMN3, Accession NM_015894) is another VGAM2349 host target gene. STMN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STMN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STMN3 BINDING SITE, designated SEQ ID:18038, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79817] Another function of VGAM2349 is therefore inhibition of Stathmin-like 3 (STMN3, Accession NM_015894). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STMN3. TUSP (Accession NM_020245) is another VGAM2349 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21525, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79818] Another function of VGAM2349 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. VI (Accession NM_013443) is another VGAM2349 host target gene. VI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VI BINDING SITE, designated SEQ ID:15107, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79819] Another function of VGAM2349 is therefore inhibition of VI (Accession NM_013443). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VI. VIT1 (Accession NM_018693) is another VGAM2349 host target gene. VIT1 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by VIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIT1 BINDING SITE, designated SEQ ID:20765, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79820] Another function of VGAM2349 is therefore inhibition of VIT1 (Accession NM_018693). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIT1. VTI2 (Accession NM_006370) is another VGAM2349 host target gene. VTI2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by VTI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VTI2 BINDING SITE, designated SEQ ID:13057, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79821] Another function of VGAM2349 is therefore inhibition of VTI2 (Accession NM_006370). Accordingly, utilities of

VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VTI2. Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM_014569) is another VGAM2349 host target gene. ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZFP95, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2, designated SEQ ID:15919 and SEQ ID:29709 respectively, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79822] Another function of VGAM2349 is therefore inhibition of Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM_014569). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95. LOC115073 (Accession XM_055193) is another VGAM2349 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36239, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79823] Another function of VGAM2349 is therefore inhibition of LOC115073 (Accession XM_055193). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC121274 (Accession XM_058547) is another VGAM2349 host target gene. LOC121274 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC121274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121274 BINDING SITE, designated SEQ ID:36656, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79824] Another function of VGAM2349 is therefore inhibition of LOC121274 (Accession XM_058547). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC121274. LOC135763 (Accession NM_138572) is another VGAM2349 host target gene. LOC135763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:28881, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79825] Another function of VGAM2349 is therefore inhibition of LOC135763 (Accession NM_138572). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135763. LOC144231 (Accession XM_096561) is another VGAM2349 host target gene. LOC144231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144231 BINDING SITE, designated SEQ ID:40393, to

the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79826] Another function of VGAM2349 is therefore inhibition of LOC144231 (Accession XM_096561). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144231. LOC144465 (Accession XM_084874) is another VGAM2349 host target gene. LOC144465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144465 BINDING SITE, designated SEQ ID:37751, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79827] Another function of VGAM2349 is therefore inhibition of LOC144465 (Accession XM_084874). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144465. LOC145945 (Accession XM_096908) is another VGAM2349 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40632, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79828] Another function of VGAM2349 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC148760 (Accession XM_097514) is another VGAM2349 host target gene. LOC148760 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148760 BINDING SITE, designated SEQ ID:40896, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79829] Another function of VGAM2349 is therefore inhibition of LOC148760 (Accession XM_097514). Accordingly, utilities

of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148760. LOC149194 (Accession XM_086458) is another VGAM2349 host target gene. LOC149194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149194 BINDING SITE, designated SEQ ID:38670, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79830] Another function of VGAM2349 is therefore inhibition of LOC149194 (Accession XM_086458). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149194. LOC151162 (Accession XM_098012) is another VGAM2349 host target gene. LOC151162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151162 BINDING SITE, designated SEQ ID:41305, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79831] Another function of VGAM2349 is therefore inhibition of LOC151162 (Accession XM_098012). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151162. LOC154449 (Accession XM_087928) is another VGAM2349 host target gene. LOC154449 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154449 BINDING SITE, designated SEQ ID:39475, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79832] Another function of VGAM2349 is therefore inhibition of LOC154449 (Accession XM_087928). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154449. LOC157450 (Accession XM_048209) is another VGAM2349 host target gene. LOC157450 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157450 BINDING SITE, designated SEQ ID:35147, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79833] Another function of VGAM2349 is therefore inhibition of LOC157450 (Accession XM_048209). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157450. LOC157860 (Accession XM_098832) is another VGAM2349 host target gene. LOC157860 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157860 BINDING SITE, designated SEQ ID:41859, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79834] Another function of VGAM2349 is therefore inhibition of

LOC157860 (Accession XM_098832). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157860. LOC158490 (Accession XM_088585) is another VGAM2349 host target gene. LOC158490 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158490 BINDING SITE, designated SEQ ID:39851, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79835] Another function of VGAM2349 is therefore inhibition of LOC158490 (Accession XM_088585). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158490. LOC158819 (Accession XM_098995) is another VGAM2349 host target gene. LOC158819 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC158819 BINDING SITE, designated SEQ ID:42025, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79836] Another function of VGAM2349 is therefore inhibition of LOC158819 (Accession XM_098995). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158819. LOC168489 (Accession XM_095134) is another VGAM2349 host target gene. LOC168489 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC168489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168489 BINDING SITE, designated SEQ ID:40250, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79837] Another function of VGAM2349 is therefore inhibition of LOC168489 (Accession XM_095134). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168489. LOC203377 (Accession XM_117540) is an-

other VGAM2349 host target gene. LOC203377 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203377 BINDING SITE, designated SEQ ID:43540, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79838] Another function of VGAM2349 is therefore inhibition of LOC203377 (Accession XM_117540). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203377. LOC221692 (Accession XM_166420) is another VGAM2349 host target gene. LOC221692 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221692 BINDING SITE, designated SEQ ID:44298, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79839] Another function of VGAM2349 is therefore inhibition of LOC221692 (Accession XM_166420). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221692. LOC221715 (Accession XM_168092) is another VGAM2349 host target gene. LOC221715 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221715 BINDING SITE, designated SEQ ID:45017, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79840] Another function of VGAM2349 is therefore inhibition of LOC221715 (Accession XM_168092). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221715. LOC254205 (Accession XM_172962) is another VGAM2349 host target gene. LOC254205 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254205, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254205 BINDING SITE, designated SEQ ID:46218, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79841] Another function of VGAM2349 is therefore inhibition of LOC254205 (Accession XM_172962). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254205. LOC255101 (Accession XM_173080) is another VGAM2349 host target gene. LOC255101 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255101 BINDING SITE, designated SEQ ID:46339, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79842] Another function of VGAM2349 is therefore inhibition of LOC255101 (Accession XM_173080). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255101. LOC256337 (Accession XM_170643) is another VGAM2349 host target gene. LOC256337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256337 BINDING SITE, designated SEQ ID:45421, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79843] Another function of VGAM2349 is therefore inhibition of LOC256337 (Accession XM_170643). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256337. LOC90309 (Accession XM_030830) is another VGAM2349 host target gene. LOC90309 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90309 BINDING SITE, designated SEQ ID:31151, to the nucleotide sequence of VGAM2349 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5060.

[79844] Another function of VGAM2349 is therefore inhibition of LOC90309 (Accession XM_030830). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90309. LOC91960 (Accession XM_041872) is another VGAM2349 host target gene. LOC91960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91960 BINDING SITE, designated SEQ ID:33612, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79845] Another function of VGAM2349 is therefore inhibition of LOC91960 (Accession XM_041872). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91960. LOC92340 (Accession XM_044426) is another VGAM2349 host target gene. LOC92340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92340, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92340 BINDING SITE, designated SEQ ID:34198, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79846] Another function of VGAM2349 is therefore inhibition of LOC92340 (Accession XM_044426). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92340. LOC92822 (Accession XM_047520) is another VGAM2349 host target gene. LOC92822 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92822 BINDING SITE, designated SEQ ID:34985, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79847] Another function of VGAM2349 is therefore inhibition of LOC92822 (Accession XM_047520). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92822. LOC93320 (Accession XM_050534) is another VGAM2349 host target gene. LOC93320 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93320 BINDING SITE, designated SEQ ID:35656, to the nucleotide sequence of VGAM2349 RNA, herein designated VGAM RNA, also designated SEQ ID:5060.

[79848] Another function of VGAM2349 is therefore inhibition of LOC93320 (Accession XM_050534). Accordingly, utilities of VGAM2349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93320. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2350 (VGAM2350) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79849] VGAM2350 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2350 was detected is described hereinabove with reference to Figs. 1-8.

[79850] VGAM2350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79851] VGAM2350 gene encodes a VGAM2350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2350 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2350 precursor RNA is designated SEQ ID:2336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2336 is located at position 13649 relative to the genome of Equine Herpesvirus 2.

[79852] VGAM2350 precursor RNA folds onto itself, forming VGAM2350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79853] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2350 folded precursor RNA into VGAM2350 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2350 RNA is designated SEQ ID:5061, and is provided hereinbelow with reference to the sequence listing part.

[79854] VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2350 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79855] VGAM2350 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2350 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2350 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79856] The complementary binding of VGAM2350 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2350 host target RNA into VGAM2350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79857] It is appreciated that VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2350 host target genes. The mRNA of each one of this plurality of VGAM2350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2350 RNA, herein designated VGAM RNA, and which when bound by VGAM2350 RNA causes inhibition of translation of respective one or more VGAM2350 host target proteins.

[79858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2350 gene, herein designated VGAM GENE, on one or more VGAM2350 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79859] It is yet further appreciated that a function of VGAM2350 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2350 correlate with, and may be deduced from, the identity of the host target genes which VGAM2350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79860] Nucleotide sequences of the VGAM2350 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2350 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2350 are further described hereinbelow with reference to Table 1.

[79861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2350 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79862] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2350 gene, herein designated VGAM is inhibition of expression of VGAM2350 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2350 correlate with, and may be deduced from, the identity of the target genes which VGAM2350 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79863] A Disintegrin and Metalloproteinase Domain 8 (ADAM8, Accession NM_001109) is a VGAM2350 host target gene. ADAM8 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by ADAM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM8 BINDING SITE, designated SEQ ID:6766, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79864] A function of VGAM2350 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 8 (ADAM8, Accession NM_001109). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM8. Bone Morphogenetic Protein 1 (BMP1, Accession NM_006131) is another VGAM2350 host target gene. BMP1 BINDING SITE1 and BMP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BMP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP1 BINDING SITE1 and BMP1 BINDING SITE2, designated SEQ ID:12771 and SEQ ID:12774 respectively, to the nucleotide sequence of VGAM2350 RNA, herein

designated VGAM RNA, also designated SEQ ID:5061.

[79865] Another function of VGAM2350 is therefore inhibition of Bone Morphogenetic Protein 1 (BMP1, Accession NM_006131), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1. The function of BMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209) is another VGAM2350 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:7970, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79866] Another function of VGAM2350 is therefore inhibition of

Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209), a gene which s a receptor for icam1, icam2, icam3 and icam4. it is involved in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293) is another VGAM2350 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8076, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79867] Another function of VGAM2350 is therefore inhibition of Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1. The function of LAMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM812.P3 (Accession NM_019848) is another VGAM2350 host target gene. P3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by P3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P3 BINDING SITE, designated SEQ ID:21255, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79868] Another function of VGAM2350 is therefore inhibition of P3 (Accession NM_019848). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P3.

Presenilin 2 (Alzheimer disease 4) (PSEN2, Accession NM_000447) is another VGAM2350 host target gene. PSEN2 BINDING SITE1 and PSEN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSEN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSEN2 BINDING SITE1 and PSEN2 BINDING SITE2, designated SEQ ID:6034 and SEQ ID:14864 respectively, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79869] Another function of VGAM2350 is therefore inhibition of Presenilin 2 (Alzheimer disease 4) (PSEN2, Accession NM_000447). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN2. Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM_004613) is another VGAM2350 host target gene. TGM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGM2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGM2 BINDING SITE, designated SEQ ID:10955, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79870] Another function of VGAM2350 is therefore inhibition of Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM_004613), a gene which catalyzes the cross-linking of proteins and the conjugation of polyamines to proteins. Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGM2. The function of TGM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM899.TIC (Accession NM_012455) is another VGAM2350 host target gene. TIC BINDING SITE1 and TIC BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TIC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIC BINDING SITE1 and TIC BINDING

SITE2, designated SEQ ID:14826 and SEQ ID:14827 respectively, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79871] Another function of VGAM2350 is therefore inhibition of TIC (Accession NM_012455). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIC. Apg4B (Accession NM_013325) is another VGAM2350 host target gene. Apg4B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Apg4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Apg4B BINDING SITE, designated SEQ ID:14976, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79872] Another function of VGAM2350 is therefore inhibition of Apg4B (Accession NM_013325). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Apg4B. Chromosome 11 Open Reading Frame 9 (C11orf9, Acces-

sion NM_013279) is another VGAM2350 host target gene. C11orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf9 BINDING SITE, designated SEQ ID:14945, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79873] Another function of VGAM2350 is therefore inhibition of Chromosome 11 Open Reading Frame 9 (C11orf9, Accession NM_013279). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf9. Calcium Channel, Voltage-dependent, Alpha 1H Subunit (CACNA1H, Accession NM_021098) is another VGAM2350 host target gene. CACNA1H BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CACNA1H, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA1H BINDING SITE,

designated SEQ ID:22077, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79874] Another function of VGAM2350 is therefore inhibition of Calcium Channel, Voltage-dependent, Alpha 1H Subunit (CACNA1H, Accession NM_021098). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1H. Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM_086803) is another VGAM2350 host target gene. CECR7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CECR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR7 BINDING SITE, designated SEQ ID:38878, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79875] Another function of VGAM2350 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM_086803). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CECR7. Chorionic Gonadotropin, Beta Polypeptide 7 (CGB7, Accession NM_033142) is another VGAM2350 host target gene. CGB7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB7 BINDING SITE, designated SEQ ID:26993, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79876] Another function of VGAM2350 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 7 (CGB7, Accession NM_033142). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB7. CRMP5 (Accession NM_020134) is another VGAM2350 host target gene. CRMP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRMP5 BINDING SITE, designated SEQ

ID:21332, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79877] Another function of VGAM2350 is therefore inhibition of CRMP5 (Accession NM_020134). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRMP5. FLJ11160 (Accession NM_018344) is another VGAM2350 host target gene. FLJ11160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11160 BINDING SITE, designated SEQ ID:20352, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79878] Another function of VGAM2350 is therefore inhibition of FLJ11160 (Accession NM_018344). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11160. FLJ12438 (Accession NM_021933) is another VGAM2350 host target gene. FLJ12438 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12438 BINDING SITE, designated SEQ ID:22455, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79879] Another function of VGAM2350 is therefore inhibition of FLJ12438 (Accession NM_021933). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12438. FLJ14957 (Accession NM_032866) is another VGAM2350 host target gene. FLJ14957 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:26682, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79880] Another function of VGAM2350 is therefore inhibition of

FLJ14957 (Accession NM_032866). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957. FLJ22195 (Accession NM_022758) is another VGAM2350 host target gene. FLJ22195 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22195 BINDING SITE, designated SEQ ID:22998, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79881] Another function of VGAM2350 is therefore inhibition of FLJ22195 (Accession NM_022758). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22195. FLJ23306 (Accession NM_024530) is another VGAM2350 host target gene. FLJ23306 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ23306 BINDING SITE, designated SEQ ID:23734, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79882] Another function of VGAM2350 is therefore inhibition of FLJ23306 (Accession NM_024530). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23306. Junctional Adhesion Molecule 1 (JAM1, Accession NM_144503) is another VGAM2350 host target gene. JAM1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by JAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE, designated SEQ ID:29339, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79883] Another function of VGAM2350 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM_144503). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. K-ALPHA-1

(Accession XM_084866) is another VGAM2350 host target gene. K-ALPHA-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by K-ALPHA-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of K-ALPHA-1 BINDING SITE, designated SEQ ID:37743, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79884] Another function of VGAM2350 is therefore inhibition of K-ALPHA-1 (Accession XM_084866). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with K-ALPHA-1. KIAA0544 (Accession XM_048119) is another VGAM2350 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:35111, to the nucleotide sequence of VGAM2350 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5061.

[79885] Another function of VGAM2350 is therefore inhibition of KIAA0544 (Accession XM_048119). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0544. KIAA0789 (Accession XM_033113) is another VGAM2350 host target gene. KIAA0789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:31847, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79886] Another function of VGAM2350 is therefore inhibition of KIAA0789 (Accession XM_033113). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789. KIAA0945 (Accession NM_014952) is another VGAM2350 host target gene. KIAA0945 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0945, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE, designated SEQ ID:17295, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79887] Another function of VGAM2350 is therefore inhibition of KIAA0945 (Accession NM_014952). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0945. KIAA1055 (Accession XM_038509) is another VGAM2350 host target gene. KIAA1055 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1055 BINDING SITE, designated SEQ ID:32851, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79888] Another function of VGAM2350 is therefore inhibition of KIAA1055 (Accession XM_038509). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1055. KIAA1762 (Accession XM_033370) is another VGAM2350 host target gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:31912, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79889] Another function of VGAM2350 is therefore inhibition of KIAA1762 (Accession XM_033370). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1762. KIAA1906 (Accession XM_055095) is another VGAM2350 host target gene. KIAA1906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1906 BINDING SITE, designated SEQ ID:36228, to the

nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79890] Another function of VGAM2350 is therefore inhibition of KIAA1906 (Accession XM_055095). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1906. Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP3K3, Accession NM_002401) is another VGAM2350 host target gene. MAP3K3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K3 BINDING SITE, designated SEQ ID:8221, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79891] Another function of VGAM2350 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP3K3, Accession NM_002401). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K3. MDN1, Midasin Homolog (yeast) (MDN1, Acces-

sion XM_031539) is another VGAM2350 host target gene. MDN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDN1 BINDING SITE, designated SEQ ID:31410, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79892] Another function of VGAM2350 is therefore inhibition of MDN1, Midasin Homolog (yeast) (MDN1, Accession XM_031539). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDN1. MGC13170 (Accession NM_032712) is another VGAM2350 host target gene. MGC13170 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13170 BINDING SITE, designated SEQ ID:26433, to the nucleotide sequence of

VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79893] Another function of VGAM2350 is therefore inhibition of MGC13170 (Accession NM_032712). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13170. Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178) is another VGAM2350 host target gene. NPTXR BINDING SITE1 and NPTXR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NPTXR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE1 and NPTXR BINDING SITE2, designated SEQ ID:27733 and SEQ ID:15585 respectively, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79894] Another function of VGAM2350 is therefore inhibition of Neuronal Pentraxin Receptor (NPTXR, Accession NM_058178). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR. START Domain

Containing 7 (STARD7, Accession NM_020151) is another VGAM2350 host target gene. STARD7 BINDING SITE1 through STARD7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STARD7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING SITE1 through STARD7 BINDING SITE3, designated SEQ ID:21357, SEQ ID:21358 and SEQ ID:29260 respectively, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79895] Another function of VGAM2350 is therefore inhibition of START Domain Containing 7 (STARD7, Accession NM_020151). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7. LOC120425 (Accession XM_058463) is another VGAM2350 host target gene. LOC120425 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC120425 BINDING SITE, designated SEQ ID:36621, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79896] Another function of VGAM2350 is therefore inhibition of LOC120425 (Accession XM_058463). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120425. LOC146823 (Accession XM_097105) is another VGAM2350 host target gene. LOC146823 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146823 BINDING SITE, designated SEQ ID:40747, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79897] Another function of VGAM2350 is therefore inhibition of LOC146823 (Accession XM_097105). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146823. LOC150372 (Accession XM_086893) is an-

other VGAM2350 host target gene. LOC150372 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150372 BINDING SITE, designated SEQ ID:38941, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79898] Another function of VGAM2350 is therefore inhibition of LOC150372 (Accession XM_086893). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150372. LOC151176 (Accession XM_098016) is another VGAM2350 host target gene. LOC151176 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151176 BINDING SITE, designated SEQ ID:41314, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79899] Another function of VGAM2350 is therefore inhibition of LOC151176 (Accession XM_098016). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151176. LOC153577 (Accession XM_098394) is another VGAM2350 host target gene. LOC153577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153577 BINDING SITE, designated SEQ ID:41644, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79900] Another function of VGAM2350 is therefore inhibition of LOC153577 (Accession XM_098394). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153577. LOC157653 (Accession XM_088353) is another VGAM2350 host target gene. LOC157653 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157653, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157653 BINDING SITE, designated SEQ ID:39634, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79901] Another function of VGAM2350 is therefore inhibition of LOC157653 (Accession XM_088353). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157653. LOC163682 (Accession XM_099402) is another VGAM2350 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42095, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79902] Another function of VGAM2350 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC163682. LOC222681 (Accession XM_167116) is another VGAM2350 host target gene. LOC222681 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222681 BINDING SITE, designated SEQ ID:44615, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79903] Another function of VGAM2350 is therefore inhibition of LOC222681 (Accession XM_167116). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222681. LOC253216 (Accession XM_170765) is another VGAM2350 host target gene. LOC253216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253216 BINDING SITE, designated SEQ ID:45518, to the nucleotide sequence of VGAM2350 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5061.

[79904] Another function of VGAM2350 is therefore inhibition of LOC253216 (Accession XM_170765). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253216. LOC257507 (Accession XM_175204) is another VGAM2350 host target gene. LOC257507 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257507 BINDING SITE, designated SEQ ID:46681, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79905] Another function of VGAM2350 is therefore inhibition of LOC257507 (Accession XM_175204). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257507. LOC257625 (Accession XM_175267) is another VGAM2350 host target gene. LOC257625 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257625, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257625 BINDING SITE, designated SEQ ID:46737, to the nucleotide sequence of VGAM2350 RNA, herein designated VGAM RNA, also designated SEQ ID:5061.

[79906] Another function of VGAM2350 is therefore inhibition of LOC257625 (Accession XM_175267). Accordingly, utilities of VGAM2350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257625. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2351 (VGAM2351) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79907] VGAM2351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2351 was detected is described hereinabove with reference to Figs. 1-8.

[79908] VGAM2351 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2.

VGAM2351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79909] VGAM2351 gene encodes a VGAM2351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2351 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2351 precursor RNA is designated SEQ ID:2337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2337 is located at position 28694 relative to the genome of Equine Herpesvirus 2.

[79910] VGAM2351 precursor RNA folds onto itself, forming VGAM2351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79911] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2351 folded precursor RNA into VGAM2351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2351 RNA is designated SEQ ID:5062, and is provided hereinbelow with reference to the sequence listing part.

[79912] VGAM2351 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2351 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79913] VGAM2351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2351 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2351 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79914] The complementary binding of VGAM2351 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2351 host target RNA into VGAM2351 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79915] It is appreciated that VGAM2351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2351 host target genes. The mRNA of each one of this plurality of VGAM2351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2351 RNA, herein designated VGAM RNA, and which when bound by VGAM2351 RNA causes inhibition of translation of respective one or more VGAM2351 host target proteins.

[79916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2351 gene, herein designated VGAM GENE, on one or more VGAM2351 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[79917] It is yet further appreciated that a function of VGAM2351 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2351 correlate with, and may be deduced from, the identity of the host target genes which VGAM2351 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79918] Nucleotide sequences of the VGAM2351 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2351 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2351 are further described hereinbelow with reference to Table 1.

[79919] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2351 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2351 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79920] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2351 gene, herein designated VGAM is inhibition of expression of VGAM2351 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2351 correlate with, and may be deduced from, the identity of the target genes which VGAM2351 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79921] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM_005099) is a VGAM2351 host target gene. ADAMTS4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAMTS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ADAMTS4 BINDING SITE, designated SEQ ID:11569, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79922] A function of VGAM2351 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM_005099), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS4. The function of ADAMTS4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM809.Activating Transcription Factor 7 (ATF7, Accession NM_006856) is another VGAM2351 host target gene. ATF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF7 BINDING SITE, designated SEQ ID:13725,

to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79923] Another function of VGAM2351 is therefore inhibition of Activating Transcription Factor 7 (ATF7, Accession NM_006856). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF7. Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151) is another VGAM2351 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5658, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79924] Another function of VGAM2351 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with G6PC. Huntingtin (Huntington disease) (HD, Accession NM_002111) is another VGAM2351 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7897, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79925] Another function of VGAM2351 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM_002111). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. Interleukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM_028349) is another VGAM2351 host target gene. IRAK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRAK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRAK4 BIND-

ING SITE, designated SEQ ID:30691, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79926] Another function of VGAM2351 is therefore inhibition of Interleukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM_028349), a gene which may function as an IRAK1 kinase, triggering a cascade of phosphorylation events. Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK4. The function of IRAK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1291.NDRG Family Member 3 (NDRG3, Accession NM_032013) is another VGAM2351 host target gene. NDRG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDRG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE, designated SEQ ID:25726, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79927] Another function of VGAM2351 is therefore inhibition of NDRG Family Member 3 (NDRG3, Accession NM_032013). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3. Regenerating Islet-derived-like, Pancreatic Stone Protein-like, Pancreatic Thread Protein-like (rat) (REGL, Accession NM_006508) is another VGAM2351 host target gene. REGL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by REGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REGL BINDING SITE, designated SEQ ID:13256, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79928] Another function of VGAM2351 is therefore inhibition of Regenerating Islet-derived-like, Pancreatic Stone Protein-like, Pancreatic Thread Protein-like (rat) (REGL, Accession NM_006508), a gene which is a member of REG family with unknown function. Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REGL.

The function of REGL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805) is another VGAM2351 host target gene. SMT3H1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMT3H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H1 BINDING SITE, designated SEQ ID:30126, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79929] Another function of VGAM2351 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805), a gene which is involved in the function and/or structure of the eukaryotic kinetochore. Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H1. The function of SMT3H1 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM119.FLJ13102 (Accession NM_024887) is another VGAM2351 host target gene. FLJ13102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13102 BINDING SITE, designated SEQ ID:24344, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79930] Another function of VGAM2351 is therefore inhibition of FLJ13102 (Accession NM_024887). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13102. FLJ20320 (Accession NM_017765) is another VGAM2351 host target gene. FLJ20320 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20320 BINDING SITE, designated SEQ ID:19384, to the nucleotide

sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79931] Another function of VGAM2351 is therefore inhibition of FLJ20320 (Accession NM_017765). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20320. FLJ20584 (Accession NM_017891) is another VGAM2351 host target gene. FLJ20584 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20584 BINDING SITE, designated SEQ ID:19562, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79932] Another function of VGAM2351 is therefore inhibition of FLJ20584 (Accession NM_017891). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20584. G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM_014030) is another VGAM2351 host target gene. GIT1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by GIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT1 BINDING SITE, designated SEQ ID:15256, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79933] Another function of VGAM2351 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM_014030). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT1. KIAA0980 (Accession NM_025176) is another VGAM2351 host target gene. KIAA0980 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0980 BINDING SITE, designated SEQ ID:24812, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79934] Another function of VGAM2351 is therefore inhibition of KIAA0980 (Accession NM_025176). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0980. KIAA1553 (Accession XM_166320) is another VGAM2351 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:44144, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79935] Another function of VGAM2351 is therefore inhibition of KIAA1553 (Accession XM_166320). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. KIAA1854 (Accession XM_049884) is another VGAM2351 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35535, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79936] Another function of VGAM2351 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM2351 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:21910, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79937] Another function of VGAM2351 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM2351 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. PHRET1 (Accession NM_021200) is another VGAM2351 host target gene. PHRET1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHRET1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHRET1 BINDING SITE, designated SEQ ID:22178, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79938] Another function of VGAM2351 is therefore inhibition of PHRET1 (Accession NM_021200). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHRET1. Ubiquitin Specific Protease 2 (USP2, Accession NM_004205) is another VGAM2351 host target gene. USP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

USP2 BINDING SITE, designated SEQ ID:10401, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79939] Another function of VGAM2351 is therefore inhibition of Ubiquitin Specific Protease 2 (USP2, Accession NM_004205). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP2. LOC130412 (Accession XM_065708) is another VGAM2351 host target gene. LOC130412 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130412 BINDING SITE, designated SEQ ID:37293, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79940] Another function of VGAM2351 is therefore inhibition of LOC130412 (Accession XM_065708). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130412. LOC146337 (Accession XM_096982) is an-

other VGAM2351 host target gene. LOC146337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146337 BINDING SITE, designated SEQ ID:40693, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79941] Another function of VGAM2351 is therefore inhibition of LOC146337 (Accession XM_096982). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146337. LOC152794 (Accession XM_087525) is another VGAM2351 host target gene. LOC152794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152794 BINDING SITE, designated SEQ ID:39322, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79942] Another function of VGAM2351 is therefore inhibition of LOC152794 (Accession XM_087525). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152794. LOC206012 (Accession XM_116275) is another VGAM2351 host target gene. LOC206012 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC206012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206012 BINDING SITE, designated SEQ ID:43110, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79943] Another function of VGAM2351 is therefore inhibition of LOC206012 (Accession XM_116275). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206012. LOC254251 (Accession XM_171088) is another VGAM2351 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254251 BINDING SITE, designated SEQ ID:45901, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79944] Another function of VGAM2351 is therefore inhibition of LOC254251 (Accession XM_171088). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. LOC257480 (Accession XM_085456) is another VGAM2351 host target gene. LOC257480 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257480, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257480 BINDING SITE, designated SEQ ID:38146, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79945] Another function of VGAM2351 is therefore inhibition of LOC257480 (Accession XM_085456). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257480. LOC257612 (Accession XM_175270) is another VGAM2351 host target gene. LOC257612 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257612 BINDING SITE, designated SEQ ID:46743, to the nucleotide sequence of VGAM2351 RNA, herein designated VGAM RNA, also designated SEQ ID:5062.

[79946] Another function of VGAM2351 is therefore inhibition of LOC257612 (Accession XM_175270). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257612. LOC91156 (Accession XM_036558) is another VGAM2351 host target gene. LOC91156 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91156 BINDING SITE, designated SEQ ID:32466, to the nucleotide sequence of VGAM2351 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5062.

[79947] Another function of VGAM2351 is therefore inhibition of LOC91156 (Accession XM_036558). Accordingly, utilities of VGAM2351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91156. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2352 (VGAM2352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[79948] VGAM2352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2352 was detected is described hereinabove with reference to Figs. 1-8.

[79949] VGAM2352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[79950] VGAM2352 gene encodes a VGAM2352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2352 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2352 precursor RNA is designated SEQ ID:2338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2338 is located at position 8029 relative to the genome of Equine Herpesvirus 2.

[79951] VGAM2352 precursor RNA folds onto itself, forming VGAM2352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[79952] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2352 folded precursor RNA into VGAM2352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2352 RNA is designated SEQ ID:5063, and is provided hereinbelow with reference to the sequence listing part.

[79953] VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2352 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[79954] VGAM2352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2352 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[79955] The complementary binding of VGAM2352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2352 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2352 host target RNA into VGAM2352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[79956] It is appreciated that VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2352 host target genes. The mRNA of

each one of this plurality of VGAM2352 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2352 RNA, herein designated VGAM RNA, and which when bound by VGAM2352 RNA causes inhibition of translation of respective one or more VGAM2352 host target proteins.

[79957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2352 gene, herein designated VGAM GENE, on one or more VGAM2352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[79958] It is yet further appreciated that a function of VGAM2352 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2352 correlate with, and may be deduced from, the identity of the host target genes which VGAM2352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[79959] Nucleotide sequences of the VGAM2352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2352 are further described hereinbelow with reference to Table 1.

[79960] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2352 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2352 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[79961] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2352 gene, herein designated VGAM is inhibition of expression of VGAM2352 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2352 correlate with, and may be deduced from, the identity of the target genes which VGAM2352 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[79962] ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM_000053) is a VGAM2352 host target gene. ATP7B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5503, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79963] A function of VGAM2352 is therefore inhibition of ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease)

(ATP7B, Accession NM_000053). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B. Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM_018644) is another VGAM2352 host target gene. B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2, designated SEQ ID:20715 and SEQ ID:27627 respectively, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79964] Another function of VGAM2352 is therefore inhibition of Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM_018644). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. CERD4 (Accession NM_012074) is another VGAM2352 host target gene.

CERD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14342, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79965] Another function of VGAM2352 is therefore inhibition of CERD4 (Accession NM_012074). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Dihydropyrimidinase-like 3 (DPYSL3, Accession NM_001387) is another VGAM2352 host target gene. DPYSL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPYSL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL3 BINDING SITE, designated SEQ ID:7069, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ

ID:5063.

[79966] Another function of VGAM2352 is therefore inhibition of Dihydropyrimidinase-like 3 (DPYSL3, Accession NM_001387), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL3. The function of DPYSL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24.Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM_002074) is another VGAM2352 host target gene. GNB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB1 BINDING SITE, designated SEQ ID:7848, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79967] Another function of VGAM2352 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta

Polypeptide 1 (GNB1, Accession NM_002074). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB1. Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417) is another VGAM2352 host target gene. IL2RA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL2RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RA BINDING SITE, designated SEQ ID:5997, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79968] Another function of VGAM2352 is therefore inhibition of Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417), a gene which plays a role in T cell mediated immune response. Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RA. The function of IL2RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1168.Low Density Lipoprotein-related Protein 1

(alpha-2-macroglobulin receptor) (LRP1, Accession NM_002332) is another VGAM2352 host target gene. LRP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1 BINDING SITE, designated SEQ ID:8135, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79969] Another function of VGAM2352 is therefore inhibition of Low Density Lipoprotein-related Protein 1 (alpha-2-macroglobulin receptor) (LRP1, Accession NM_002332), a gene which is a recycling lipoprotein receptor with possible growth-modulating effects. Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1. The function of LRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885.MAX Gene Associated (MGA, Accession XM_031689) is another VGAM2352 host target gene. MGA BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by MGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGA BINDING SITE, designated SEQ ID:31453, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79970] Another function of VGAM2352 is therefore inhibition of MAX Gene Associated (MGA, Accession XM_031689), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGA. The function of MGA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2003.Moesin (MSN, Accession XM_013042) is another VGAM2352 host target gene. MSN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSN BINDING SITE, designated SEQ

ID:30224, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79971] Another function of VGAM2352 is therefore inhibition of Moesin (MSN, Accession XM_013042), a gene which may have a role linking the cytoskeleton to the plasma membrane. Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSN. The function of MSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM248.RAN Binding Protein 3 (RANBP3, Accession NM_003624) is another VGAM2352 host target gene. RANBP3 BINDING SITE1 and RANBP3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RANBP3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP3 BINDING SITE1 and RANBP3 BINDING SITE2, designated SEQ ID:9687 and SEQ ID:14239 respectively, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ

ID:5063.

[79972] Another function of VGAM2352 is therefore inhibition of RAN Binding Protein 3 (RANBP3, Accession NM_003624). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP3. Zinc Finger Protein 141 (clone pHZ-44) (ZNF141, Accession NM_003441) is another VGAM2352 host target gene. ZNF141 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF141 BINDING SITE, designated SEQ ID:9496, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79973] Another function of VGAM2352 is therefore inhibition of Zinc Finger Protein 141 (clone pHZ-44) (ZNF141, Accession NM_003441). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF141. AFAP (Accession NM_021638) is another VGAM2352 host target gene. AFAP BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:22289, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79974] Another function of VGAM2352 is therefore inhibition of AFAP (Accession NM_021638). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. Discoidin Domain Receptor Family, Member 1 (DDR1, Accession NM_013993) is another VGAM2352 host target gene. DDR1 BINDING SITE1 through DDR1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDR1 BINDING SITE1 through DDR1 BINDING SITE3, designated SEQ ID:15178, SEQ ID:15180 and SEQ ID:7677 respectively, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79975] Another function of VGAM2352 is therefore inhibition of Discoidin Domain Receptor Family, Member 1 (DDR1, Accession NM_013993). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDR1. FLJ12895 (Accession NM_023926) is another VGAM2352 host target gene. FLJ12895 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12895 BINDING SITE, designated SEQ ID:23403, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79976] Another function of VGAM2352 is therefore inhibition of FLJ12895 (Accession NM_023926). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12895. FLJ13150 (Accession NM_024813) is another VGAM2352 host target gene. FLJ13150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13150, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13150 BINDING SITE, designated SEQ ID:24200, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79977] Another function of VGAM2352 is therefore inhibition of FLJ13150 (Accession NM_024813). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13150. FLJ20209 (Accession XM_098142) is another VGAM2352 host target gene. FLJ20209 BINDING SITE1 and FLJ20209 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20209, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20209 BINDING SITE1 and FLJ20209 BINDING SITE2, designated SEQ ID:41402 and SEQ ID:41403 respectively, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79978] Another function of VGAM2352 is therefore inhibition of

FLJ20209 (Accession XM_098142). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20209. HIG2 (Accession NM_013332) is another VGAM2352 host target gene. HIG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIG2 BINDING SITE, designated SEQ ID:14977, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79979] Another function of VGAM2352 is therefore inhibition of HIG2 (Accession NM_013332). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIG2. KIAA0355 (Accession NM_014686) is another VGAM2352 host target gene. KIAA0355 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0355 BINDING SITE, designated SEQ ID:16187, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79980] Another function of VGAM2352 is therefore inhibition of KIAA0355 (Accession NM_014686). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0355. KIAA0514 (Accession NM_014696) is another VGAM2352 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16200, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79981] Another function of VGAM2352 is therefore inhibition of KIAA0514 (Accession NM_014696). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA0545 (Accession XM_032278) is another

VGAM2352 host target gene. KIAA0545 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0545 BINDING SITE, designated SEQ ID:31633, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79982] Another function of VGAM2352 is therefore inhibition of KIAA0545 (Accession XM_032278). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0545. KIAA1272 (Accession XM_046600) is another VGAM2352 host target gene. KIAA1272 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1272 BINDING SITE, designated SEQ ID:34759, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79983] Another function of VGAM2352 is therefore inhibition of KIAA1272 (Accession XM_046600). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1272. KIAA1871 (Accession XM_028409) is another VGAM2352 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30702, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79984] Another function of VGAM2352 is therefore inhibition of KIAA1871 (Accession XM_028409). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. KIAA1879 (Accession XM_056635) is another VGAM2352 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36412, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79985] Another function of VGAM2352 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. Phosphate Cytidylyltransferase 2, Ethanolamine (PCYT2, Accession NM_002861) is another VGAM2352 host target gene. PCYT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCYT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCYT2 BINDING SITE, designated SEQ ID:8761, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79986] Another function of VGAM2352 is therefore inhibition of Phosphate Cytidylyltransferase 2, Ethanolamine (PCYT2, Accession NM_002861). Accordingly, utilities of

VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCYT2. Ubiquitin Specific Protease 22 (USP22, Accession XM_042698) is another VGAM2352 host target gene. USP22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP22 BINDING SITE, designated SEQ ID:33750, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79987] Another function of VGAM2352 is therefore inhibition of Ubiquitin Specific Protease 22 (USP22, Accession XM_042698). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP22. LOC112476 (Accession NM_145239) is another VGAM2352 host target gene. LOC112476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112476 BINDING SITE, designated SEQ ID:29749, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79988] Another function of VGAM2352 is therefore inhibition of LOC112476 (Accession NM_145239). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112476. LOC144501 (Accession XM_096612) is another VGAM2352 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40422, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79989] Another function of VGAM2352 is therefore inhibition of LOC144501 (Accession XM_096612). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144501. LOC150935 (Accession XM_087049) is another VGAM2352 host target gene. LOC150935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150935 BINDING SITE, designated SEQ ID:39018, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79990] Another function of VGAM2352 is therefore inhibition of LOC150935 (Accession XM_087049). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150935. LOC151178 (Accession XM_087117) is another VGAM2352 host target gene. LOC151178 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151178 BINDING SITE, designated SEQ ID:39068, to the nucleotide sequence of VGAM2352 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5063.

[79991] Another function of VGAM2352 is therefore inhibition of LOC151178 (Accession XM_087117). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151178. LOC155435 (Accession XM_088257) is another VGAM2352 host target gene. LOC155435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155435 BINDING SITE, designated SEQ ID:39567, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79992] Another function of VGAM2352 is therefore inhibition of LOC155435 (Accession XM_088257). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155435. LOC163115 (Accession XM_092010) is another VGAM2352 host target gene. LOC163115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163115, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163115 BINDING SITE, designated SEQ ID:40088, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79993] Another function of VGAM2352 is therefore inhibition of LOC163115 (Accession XM_092010). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163115. LOC163682 (Accession XM_099402) is another VGAM2352 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42083, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79994] Another function of VGAM2352 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC163682. LOC197259 (Accession XM_113849) is another VGAM2352 host target gene. LOC197259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197259 BINDING SITE, designated SEQ ID:42471, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79995] Another function of VGAM2352 is therefore inhibition of LOC197259 (Accession XM_113849). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197259. LOC201895 (Accession XM_114396) is another VGAM2352 host target gene. LOC201895 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201895 BINDING SITE, designated SEQ ID:42924, to

the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79996] Another function of VGAM2352 is therefore inhibition of LOC201895 (Accession XM_114396). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201895. LOC220758 (Accession XM_165466) is another VGAM2352 host target gene. LOC220758 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220758 BINDING SITE, designated SEQ ID:43641, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79997] Another function of VGAM2352 is therefore inhibition of LOC220758 (Accession XM_165466). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220758. LOC221272 (Accession XM_168050) is another VGAM2352 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:44961, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79998] Another function of VGAM2352 is therefore inhibition of LOC221272 (Accession XM_168050). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221272. LOC221584 (Accession XM_168132) is another VGAM2352 host target gene. LOC221584 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221584 BINDING SITE, designated SEQ ID:45040, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[79999] Another function of VGAM2352 is therefore inhibition of LOC221584 (Accession XM_168132). Accordingly, utilities

of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221584. LOC254181 (Accession XM_174526) is another VGAM2352 host target gene. LOC254181 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254181 BINDING SITE, designated SEQ ID:46596, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[80000] Another function of VGAM2352 is therefore inhibition of LOC254181 (Accession XM_174526). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254181. LOC51152 (Accession NM_016181) is another VGAM2352 host target gene. LOC51152 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC51152 BINDING SITE, designated SEQ ID:18282, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[80001] Another function of VGAM2352 is therefore inhibition of LOC51152 (Accession NM_016181). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51152. LOC51580 (Accession NM_015874) is another VGAM2352 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18009, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[80002] Another function of VGAM2352 is therefore inhibition of LOC51580 (Accession NM_015874). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. LOC56963 (Accession XM_049372) is another VGAM2352 host target gene. LOC56963 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56963 BINDING SITE, designated SEQ ID:35398, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[80003] Another function of VGAM2352 is therefore inhibition of LOC56963 (Accession XM_049372). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56963. LOC90317 (Accession XM_030892) is another VGAM2352 host target gene. LOC90317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90317 BINDING SITE, designated SEQ ID:31205, to the nucleotide sequence of VGAM2352 RNA, herein designated VGAM RNA, also designated SEQ ID:5063.

[80004] Another function of VGAM2352 is therefore inhibition of

LOC90317 (Accession XM_030892). Accordingly, utilities of VGAM2352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2353 (VGAM2353) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80005] VGAM2353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2353 was detected is described hereinabove with reference to Figs. 1-8.

[80006] VGAM2353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80007] VGAM2353 gene encodes a VGAM2353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2353 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2353 precursor RNA is designated SEQ ID:2339, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2339 is located at position 15043 relative to the genome of Equine Herpesvirus 2.

[80008] VGAM2353 precursor RNA folds onto itself, forming VGAM2353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80009] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2353 folded precursor RNA into VGAM2353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide se-

quence of VGAM2353 RNA is designated SEQ ID:5064, and is provided hereinbelow with reference to the sequence listing part.

[80010] VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2353 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80011] VGAM2353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2353 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80012] The complementary binding of VGAM2353 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2353 host target RNA into VGAM2353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80013] It is appreciated that VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2353 host target genes. The mRNA of each one of this plurality of VGAM2353 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2353 RNA, herein designated VGAM RNA, and which when bound by VGAM2353 RNA causes inhibition of translation of respective one or more VGAM2353 host target proteins.

[80014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2353 gene, herein designated VGAM GENE, on one or more VGAM2353 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80015] It is yet further appreciated that a function of VGAM2353

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2353 correlate with, and may be deduced from, the identity of the host target genes which VGAM2353 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80016] Nucleotide sequences of the VGAM2353 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2353 are further described hereinbelow with reference to Table 1.

[80017] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2353 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2353 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80018] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2353 gene, herein designated VGAM is inhibition of expression of VGAM2353 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2353 correlate with, and may be deduced from, the identity of the target genes which VGAM2353 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80019] Aristaless-like Homeobox 3 (ALX3, Accession NM_006492) is a VGAM2353 host target gene. ALX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALX3 BINDING SITE, designated SEQ ID:13223, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80020] A function of VGAM2353 is therefore inhibition of Aristaless-like Homeobox 3 (ALX3, Accession NM_006492), a gene which is involved in cell-type differentiation and development. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with ALX3. The function of ALX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.AT-binding Transcription Factor 1 (ATBF1, Accession NM_006885) is another VGAM2353 host target gene. ATBF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATBF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATBF1 BINDING SITE, designated SEQ ID:13749, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80021] Another function of VGAM2353 is therefore inhibition of AT-binding Transcription Factor 1 (ATBF1, Accession NM_006885). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATBF1. ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM_000053) is another VGAM2353 host target gene. ATP7B BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5507, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80022] Another function of VGAM2353 is therefore inhibition of ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM_000053). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B. AXL Receptor Tyrosine Kinase (AXL, Accession NM_001699) is another VGAM2353 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:7424 and SEQ ID:22445 respectively, to the nucleotide sequence of VGAM2353 RNA,

herein designated VGAM RNA, also designated SEQ ID:5064.

[80023] Another function of VGAM2353 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM_001699). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM_020131) is another VGAM2353 host target gene. C1orf6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C1orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf6 BINDING SITE, designated SEQ ID:21329, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80024] Another function of VGAM2353 is therefore inhibition of Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM_020131), a gene which may link ataxin-1 with the chaperone and ubiquitin/proteasome pathways . Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with C1orf6. The function of C1orf6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1286.Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM_045786) is another VGAM2353 host target gene. CIT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:34564, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80025] Another function of VGAM2353 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM_045786), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT. The function of CIT and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM393.Dopamine Beta-hydroxylase (dopamine beta-monooxygenase) (DBH, Accession NM_000787) is another VGAM2353 host target gene. DBH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DBH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBH BINDING SITE, designated SEQ ID:6440, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80026] Another function of VGAM2353 is therefore inhibition of Dopamine Beta-hydroxylase (dopamine beta-monooxygenase) (DBH, Accession NM_000787), a gene which converts dopamine to norepinephrine . Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBH. The function of DBH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473) is another VGAM2353 host target gene. FOXE1 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXE1 BINDING SITE, designated SEQ ID:10784, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80027] Another function of VGAM2353 is therefore inhibition of Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE1. GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491) is another VGAM2353 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:27849 and SEQ ID:14654 respectively, to the nucleotide sequence of

VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80028] Another function of VGAM2353 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.Host Cell Factor C1 (VP16-accessory protein) (HCFC1, Accession XM_048390) is another VGAM2353 host target gene. HCFC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCFC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCFC1 BINDING SITE, designated SEQ ID:35159, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80029] Another function of VGAM2353 is therefore inhibition of

Host Cell Factor C1 (VP16-accessory protein) (HCFC1, Accession XM_048390), a gene which is a host cell factor, has a role in cell proliferation and can form a complex with HSV VP16. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCFC1. The function of HCFC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.HERV-H LTR-associating 1 (HHLA1, Accession NM_005712) is another VGAM2353 host target gene. HHLA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HHLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA1 BINDING SITE, designated SEQ ID:12263, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80030] Another function of VGAM2353 is therefore inhibition of HERV-H LTR-associating 1 (HHLA1, Accession NM_005712), a gene which has unknown function and

with low similarity to a region of S. cerevisiae WSC4. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA1. The function of HHLA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM158.Hexokinase 2 (HK2, Accession NM_000189) is another VGAM2353 host target gene. HK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HK2 BINDING SITE, designated SEQ ID:5690, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80031] Another function of VGAM2353 is therefore inhibition of Hexokinase 2 (HK2, Accession NM_000189), a gene which plays an important role in intracellular glucose metabolism by catalyzing the conversion of glucose to glucose-6-phosphate. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HK2. The function

of HK2 has been established by previous studies. Hexokinase II is the major hexokinase expressed in skeletal muscle. Insulin has been shown to increase transcription of this gene. Lehto et al. (1993) described the isolation of genomic clones for human hexokinase-2. These clones were isolated by screening a human placental genomic library with a rat hexokinase-2 cDNA clone. A genomic clone derived from this screening was used in fluorescence in situ hybridization studies and was found to map to human chromosome 2p13.1. The human HK2 genomic clones were also screened for dinucleotide repeats. Primers were selected to amplify an approximately 224-bp CA-repeat-rich region. This repeat region was highly polymorphic; the level of heterozygosity was 0.63 in Caucasians and 0.51 in Chinese subjects. Lehto et al. (1993) carried out linkage studies between this HK2 polymorphism and 9 markers on chromosome 2. No recombinants were observed between HK2 and TGFA (OMIM Ref. No. 190170) and D2S45; the most likely map order with respect to several chromosomal markers was determined. The HK2 gene is highly expressed in rapidly growing tumors to facilitate high rates of glucose catabolism. Mathupala et al. (1995) cloned and characterized the promoter

of the rat HK2 gene from a highly glycolytic hepatoma cell line (OMIM Ref. No. AS-30D). Mathupala et al. (1997) showed that the HK2 promoter contains functionally active response elements for p53 (OMIM Ref. No. 191170). Using coexpression assays, they showed that overexpression of a mutant p53 gene found in the tumor cell line significantly and reproducibly activated the HK2 promoter and increased HK2 gene expression. Mathupala et al. (1997) stated that theirs was the first report of a possible link between loss of cell cycle control in rapidly growing cells and their high glycolytic rate.

[80032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[80033] Lehto, M.; Xiang, K.; Stoffel, M.; Espinosa, R., III; Groop, L. C.; Le Beau, M. M.; Bell, G. I. : Human hexokinase II: localization of the polymorphic gene to chromosome 2. Diabetologia 36: 1299-1302, 1993. ; and

[80034] Mathupala, S. P.; Heese, C.; Pedersen, P. L. : Glucose catabolism in cancer cells: the type II hexokinase promoter contains functionally active response elements for the tumor suppressor.

[80035] Further studies establishing the function and utilities of

HK2 are found in John Hopkins OMIM database record ID 601125, and in sited publications numbered 6874-6881 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411) is another VGAM2353 host target gene. HLCS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HLCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:5991, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80036] Another function of VGAM2353 is therefore inhibition of Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS. Insulin Receptor Substrate 1 (IRS1, Accession NM_005544) is another VGAM2353 host

target gene. IRS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS1 BINDING SITE, designated SEQ ID:12068, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80037] Another function of VGAM2353 is therefore inhibition of Insulin Receptor Substrate 1 (IRS1, Accession NM_005544), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS1. The function of IRS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281.Insulin Receptor Substrate 2 (IRS2, Accession XM_007095) is another VGAM2353 host target gene. IRS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IRS2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS2 BINDING SITE, designated SEQ ID:30031, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80038] Another function of VGAM2353 is therefore inhibition of Insulin Receptor Substrate 2 (IRS2, Accession XM_007095), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS2. The function of IRS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1217.Potassium Voltage-gated Channel, Shaw-related Subfamily, Member 3 (KCNC3, Accession NM_004977) is another VGAM2353 host target gene. KCNC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNC3 BINDING SITE, designated SEQ

ID:11421, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80039] Another function of VGAM2353 is therefore inhibition of Potassium Voltage-gated Channel, Shaw-related Subfamily, Member 3 (KCNC3, Accession NM_004977), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNC3. The function of KCNC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476.Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM_033310) is another VGAM2353 host target gene. KCNK4 BINDING SITE1 and KCNK4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KCNK4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE1 and KCNK4 BINDING SITE2, designated SEQ ID:27151 and SEQ ID:27152 re-

spectively, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80040] Another function of VGAM2353 is therefore inhibition of Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM_033310). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4. LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM_005574) is another VGAM2353 host target gene. LMO2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LMO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO2 BINDING SITE, designated SEQ ID:12101, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80041] Another function of VGAM2353 is therefore inhibition of LIM Domain Only 2 (rhombotin-like 1) (LMO2, Accession NM_005574). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO2. LNK (Accession

NM_005475) is another VGAM2353 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:11975, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80042] Another function of VGAM2353 is therefore inhibition of LNK (Accession NM_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115.Megakaryocyte-associated Tyrosine Kinase (MATK, Accession NM_139354) is another VGAM2353 host target gene. MATK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by MATK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATK BINDING SITE, designated SEQ ID:29304, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80043] Another function of VGAM2353 is therefore inhibition of Megakaryocyte-associated Tyrosine Kinase (MATK, Accession NM_139354), a gene which can phosphorylate members of the SRC family of PTKs at the regulatory tyrosine residue. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATK. The function of MATK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2173.Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM_002408) is another VGAM2353 host target gene. MGAT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGAT2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT2 BINDING SITE, designated SEQ ID:8232, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80044] Another function of VGAM2353 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM_002408). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT2. Mucin and Cadherin-like (MUCDHL, Accession XM_113227) is another VGAM2353 host target gene. MUCDHL BINDING SITE1 and MUCDHL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MUCDHL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUCDHL BINDING SITE1 and MUCDHL BINDING SITE2, designated SEQ ID:42209 and SEQ ID:25284 respectively, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ

ID:5064.

[80045] Another function of VGAM2353 is therefore inhibition of Mucin and Cadherin-like (MUCDHL, Accession XM_113227). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUCDHL. Neurexin 2 (NRXN2, Accession NM_015080) is another VGAM2353 host target gene. NRXN2 BINDING SITE1 and NRXN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN2 BINDING SITE1 and NRXN2 BINDING SITE2, designated SEQ ID:17469 and SEQ ID:28985 respectively, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80046] Another function of VGAM2353 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM_015080), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

NRXN2. The function of NRXN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430) is another VGAM2353 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ ID:6011, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80047] Another function of VGAM2353 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. poly(rC) Binding Protein 1 (PCBP1, Accession NM_006196) is another VGAM2353 host target gene. PCBP1 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by PCBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCBP1 BINDING SITE, designated SEQ ID:12869, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80048] Another function of VGAM2353 is therefore inhibition of poly(rC) Binding Protein 1 (PCBP1, Accession NM_006196), a gene which binds preferentially to oligo dc. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP1. The function of PCBP1 has been established by previous studies. Leffers et al. (1995) described the cloning and characterization of 2 cDNAs for poly(rC)-binding proteins, called PCBP1 and PCBP2 (OMIM Ref. No. 601210) by them. The authors analyzed an EST database for sequences that were predicted to encode a protein with K-homologous (KH) domains. The 60- to 70-amino acid KH motifs are found in several putative nucleic acid binding proteins such as FMR1 (OMIM Ref. No. 309550) and HNRNPK (OMIM Ref. No. 600712) and

are thought to be involved in RNA binding. Using primers from 1 EST the authors produced a probe that was used to screen a cDNA library of transformed human amnion cells. The cDNA they isolated for PCBP1 encodes a putative 356-amino acid protein that contains 3 KH domains. It is 83% identical to PCBP2 at the DNA level and 90% homologous at the amino acid level. The PCBP1 protein is about 85% similar to the mouse hnRNP-X/mCTBP protein (Hahm et al., 1993). When expressed with a vaccinia virus system in transformed amnion cells, Leffers et al. (1995) found that both PCBP1 and PCBP2 bound poly(rC) when not phosphorylated; phosphorylated protein bound with much lower affinity. Transcripts of both PCBPs were detected in all the human tissues analyzed. Tommerup and Leffers (1996) mapped PCBP1 to 2p13-p12 by fluorescence in situ hybridization.

[80049] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[80050] Leffers, H.; Dejgaard, K.; Celis, J. E. : Characterisation of two major cellular poly(rC)-binding human proteins, each containing three K-homologous (KH) domains. Europ. J. Biochem. 230: 447-453, 1995. ; and

[80051] Tommerup, N.; Leffers, H. : Assignment of human KH-box-containing genes by in situ hybridization: HNRNPK maps to 9q21.32-q21.33, PCBP1 to 2p12-p13, and PCBP2 to 12q13.12-q13.13, distal t.

[80052] Further studies establishing the function and utilities of PCBP1 are found in John Hopkins OMIM database record ID 601209, and in sited publications numbered 6885-688 and 10050 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Protocadherin 9 (PCDH9, Accession XM_096054) is another VGAM2353 host target gene. PCDH9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH9 BINDING SITE, designated SEQ ID:40295, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80053] Another function of VGAM2353 is therefore inhibition of Protocadherin 9 (PCDH9, Accession XM_096054). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with PCDH9. Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823) is another VGAM2353 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13701, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80054] Another function of VGAM2353 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. RAD50 Homolog (S. cerevisiae) (RAD50, Accession NM_005732) is another VGAM2353 host target gene. RAD50 BINDING SITE1 and RAD50 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD50, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of RAD50 BINDING SITE1 and RAD50 BINDING SITE2, designated SEQ ID:12295 and SEQ ID:28552 respectively, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80055] Another function of VGAM2353 is therefore inhibition of RAD50 Homolog (S. cerevisiae) (RAD50, Accession NM_005732), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50. The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977) is another VGAM2353 host target gene. SLC22A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A3 BINDING SITE, designated SEQ

ID:22505, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80056] Another function of VGAM2353 is therefore inhibition of Solute Carrier Family 22 (extraneuronal monoamine transporter), Member 3 (SLC22A3, Accession NM_021977), a gene which is a sodium-ion dependent, high affinity carnitine transporter. also transports organic cations without the involvement of sodium. involved in the active cellular uptake of carnitine. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A3. The function of SLC22A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM2147.SMAC (Accession NM_138930) is another VGAM2353 host target gene. SMAC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SMAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:29053, to the nucleotide sequence of

VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80057] Another function of VGAM2353 is therefore inhibition of SMAC (Accession NM_138930), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC. The function of SMAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.SMG1 (Accession NM_015092) is another VGAM2353 host target gene. SMG1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SMG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMG1 BINDING SITE, designated SEQ ID:17479, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80058] Another function of VGAM2353 is therefore inhibition of SMG1 (Accession NM_015092), a gene which acts as the target for the cell-cycle arrest and immunosuppressive ef-

fects. Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMG1. The function of SMG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.SRY (sex determining region Y)-box 10 (SOX10, Accession NM_006941) is another VGAM2353 host target gene. SOX10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SOX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX10 BINDING SITE, designated SEQ ID:13824, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80059] Another function of VGAM2353 is therefore inhibition of SRY (sex determining region Y)-box 10 (SOX10, Accession NM_006941). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX10. SRP46 (Accession NM_032102) is another VGAM2353 host target gene.

SRP46 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SRP46, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRP46 BINDING SITE, designated SEQ ID:25791, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80060] Another function of VGAM2353 is therefore inhibition of SRP46 (Accession NM_032102). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRP46. Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283) is another VGAM2353 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:12967, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5064.

[80061] Another function of VGAM2353 is therefore inhibition of Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. Thymidine Kinase 1, Soluble (TK1, Accession NM_003258) is another VGAM2353 host target gene. TK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TK1 BINDING SITE, designated SEQ ID:9270, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80062] Another function of VGAM2353 is therefore inhibition of Thymidine Kinase 1, Soluble (TK1, Accession NM_003258). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TK1. Vasoactive Intestinal Peptide Receptor 2 (VIPR2, Accession NM_003382) is another VGAM2353 host target gene. VIPR2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VIPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIPR2 BINDING SITE, designated SEQ ID:9414, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80063] Another function of VGAM2353 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 2 (VIPR2, Accession NM_003382). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR2. Bruno-like 6, RNA Binding Protein (Drosophila) (BRUNOL6, Accession NM_052840) is another VGAM2353 host target gene. BRUNOL6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BRUNOL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRUNOL6 BINDING SITE, designated SEQ ID:27421, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ

ID:5064.

[80064] Another function of VGAM2353 is therefore inhibition of Bruno-like 6, RNA Binding Protein (Drosophila) (BRUNOL6, Accession NM_052840). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRUNOL6. Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191) is another VGAM2353 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:42771, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80065] Another function of VGAM2353 is therefore inhibition of Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. CAPN13 (Accession NM_144575) is another

VGAM2353 host target gene. CAPN13 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CAPN13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN13 BINDING SITE, designated SEQ ID:29380, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80066] Another function of VGAM2353 is therefore inhibition of CAPN13 (Accession NM_144575). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN13. CDT1 (Accession XM_085327) is another VGAM2353 host target gene. CDT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT1 BINDING SITE, designated SEQ ID:38066, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80067] Another function of VGAM2353 is therefore inhibition of CDT1 (Accession XM_085327). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT1. DKFZP434N1511 (Accession XM_166138) is another VGAM2353 host target gene. DKFZP434N1511 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434N1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N1511 BINDING SITE, designated SEQ ID:43939, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80068] Another function of VGAM2353 is therefore inhibition of DKFZP434N1511 (Accession XM_166138). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N1511. DKFZP586J1624 (Accession NM_015537) is another VGAM2353 host target gene. DKFZP586J1624 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

DKFZP586J1624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586J1624 BINDING SITE, designated SEQ ID:17798, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80069] Another function of VGAM2353 is therefore inhibition of DKFZP586J1624 (Accession NM_015537). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586J1624. DKFZP727G051 (Accession XM_045308) is another VGAM2353 host target gene. DKFZP727G051 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP727G051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727G051 BINDING SITE, designated SEQ ID:34430, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80070] Another function of VGAM2353 is therefore inhibition of

DKFZP727G051 (Accession XM_045308). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727G051. EHM2 (Accession NM_019114) is another VGAM2353 host target gene. EHM2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EHM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHM2 BINDING SITE, designated SEQ ID:21190, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80071] Another function of VGAM2353 is therefore inhibition of EHM2 (Accession NM_019114). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHM2. Epsin 2 (EPN2, Accession NM_014964) is another VGAM2353 host target gene. EPN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:17348, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80072] Another function of VGAM2353 is therefore inhibition of Epsin 2 (EPN2, Accession NM_014964). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2. FLJ00001 (Accession XM_088525) is another VGAM2353 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39780, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80073] Another function of VGAM2353 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ13441 (Accession NM_023924) is another

VGAM2353 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23395, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80074] Another function of VGAM2353 is therefore inhibition of FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. FLJ20085 (Accession NM_017660) is another VGAM2353 host target gene. FLJ20085 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20085 BINDING SITE, designated SEQ ID:19186, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80075] Another function of VGAM2353 is therefore inhibition of FLJ20085 (Accession NM_017660). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20085. FLJ20898 (Accession NM_024600) is another VGAM2353 host target gene. FLJ20898 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20898 BINDING SITE, designated SEQ ID:23851, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80076] Another function of VGAM2353 is therefore inhibition of FLJ20898 (Accession NM_024600). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20898. FLJ22246 (Accession NM_025232) is another VGAM2353 host target gene. FLJ22246 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22246 BINDING SITE, designated SEQ ID:24909, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80077] Another function of VGAM2353 is therefore inhibition of FLJ22246 (Accession NM_025232). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22246. FLJ22408 (Accession NM_024794) is another VGAM2353 host target gene. FLJ22408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22408 BINDING SITE, designated SEQ ID:24173, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80078] Another function of VGAM2353 is therefore inhibition of FLJ22408 (Accession NM_024794). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22408. HRD1 (Accession XM_045498) is another VGAM2353 host target gene. HRD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:34473, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80079] Another function of VGAM2353 is therefore inhibition of HRD1 (Accession XM_045498). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1. HSPC195 (Accession XM_087785) is another VGAM2353 host target gene. HSPC195 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPC195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC195 BINDING SITE, designated SEQ ID:39422, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5064.

[80080] Another function of VGAM2353 is therefore inhibition of HSPC195 (Accession XM_087785). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC195. KH-type Splicing Regulatory Protein (FUSE binding protein 2) (KHSRP, Accession NM_003685) is another VGAM2353 host target gene. KHSRP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KHSRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHSRP BINDING SITE, designated SEQ ID:9796, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80081] Another function of VGAM2353 is therefore inhibition of KH-type Splicing Regulatory Protein (FUSE binding protein 2) (KHSRP, Accession NM_003685). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHSRP. KIAA0420 (Accession XM_032693) is another VGAM2353 host target gene. KIAA0420 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31728, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80082] Another function of VGAM2353 is therefore inhibition of KIAA0420 (Accession XM_032693). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA0513 (Accession NM_014732) is another VGAM2353 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16359, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80083] Another function of VGAM2353 is therefore inhibition of

KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0545 (Accession XM_032278) is another VGAM2353 host target gene. KIAA0545 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0545 BINDING SITE, designated SEQ ID:31632, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80084] Another function of VGAM2353 is therefore inhibition of KIAA0545 (Accession XM_032278). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0545. KIAA0668 (Accession XM_039332) is another VGAM2353 host target gene. KIAA0668 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0668 BINDING SITE, designated SEQ ID:33050, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80085] Another function of VGAM2353 is therefore inhibition of KIAA0668 (Accession XM_039332). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0668. KIAA0672 (Accession NM_014859) is another VGAM2353 host target gene. KIAA0672 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0672 BINDING SITE, designated SEQ ID:16920, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80086] Another function of VGAM2353 is therefore inhibition of KIAA0672 (Accession NM_014859). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0672. KIAA0987 (Accession NM_012307) is another

VGAM2353 host target gene. KIAA0987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0987 BINDING SITE, designated SEQ ID:14677, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80087] Another function of VGAM2353 is therefore inhibition of KIAA0987 (Accession NM_012307). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0987. KIAA1170 (Accession XM_045907) is another VGAM2353 host target gene. KIAA1170 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:34612, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80088] Another function of VGAM2353 is therefore inhibition of KIAA1170 (Accession XM_045907). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170. KIAA1867 (Accession XM_170675) is another VGAM2353 host target gene. KIAA1867 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1867 BINDING SITE, designated SEQ ID:45455, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80089] Another function of VGAM2353 is therefore inhibition of KIAA1867 (Accession XM_170675). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1867. KIAA1904 (Accession XM_056282) is another VGAM2353 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36377, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80090] Another function of VGAM2353 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. KIAA1906 (Accession XM_055095) is another VGAM2353 host target gene. KIAA1906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1906 BINDING SITE, designated SEQ ID:36231, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80091] Another function of VGAM2353 is therefore inhibition of KIAA1906 (Accession XM_055095). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1906. KIAA1924 (Accession XM_057091) is another VGAM2353 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36479, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80092] Another function of VGAM2353 is therefore inhibition of KIAA1924 (Accession XM_057091). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. LHPP (Accession NM_022126) is another VGAM2353 host target gene. LHPP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHPP BINDING SITE, designated SEQ ID:22678, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:5064.

[80093] Another function of VGAM2353 is therefore inhibition of LHPP (Accession NM_022126). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHPP. Mannosidase, Beta A, Lysosomal-like (MANBAL, Accession NM_022077) is another VGAM2353 host target gene. MANBAL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MANBAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MANBAL BINDING SITE, designated SEQ ID:22620, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80094] Another function of VGAM2353 is therefore inhibition of Mannosidase, Beta A, Lysosomal-like (MANBAL, Accession NM_022077). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MANBAL. Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM_004759) is another VGAM2353 host target

gene. MAPKAPK2 BINDING SITE1 and MAPKAPK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPKAPK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPKAPK2 BINDING SITE1 and MAPKAPK2 BINDING SITE2, designated SEQ ID:11150 and SEQ ID:26764 respectively, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80095] Another function of VGAM2353 is therefore inhibition of Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM_004759). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKAPK2. NS1-BP (Accession XM_051877) is another VGAM2353 host target gene. NS1-BP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NS1-BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NS1-BP BINDING SITE, designated SEQ ID:35913, to the nucleotide se-

quence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80096] Another function of VGAM2353 is therefore inhibition of NS1-BP (Accession XM_051877). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NS1-BP. OBTP (Accession NM_017601) is another VGAM2353 host target gene. OBTP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OBTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBTP BINDING SITE, designated SEQ ID:19080, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80097] Another function of VGAM2353 is therefore inhibition of OBTP (Accession NM_017601). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBTP. Peptidyl Arginine Deiminase, Type I (PADI1, Accession XM_030498) is another VGAM2353 host target gene. PADI1 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by PADI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PADI1 BINDING SITE, designated SEQ ID:31055, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80098] Another function of VGAM2353 is therefore inhibition of Peptidyl Arginine Deiminase, Type I (PADI1, Accession XM_030498). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PADI1.

p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM2353 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:21391, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80099] Another function of VGAM2353 is therefore inhibition of p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. QKI (Accession XM_037438) is another VGAM2353 host target gene. QKI BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by QKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QKI BINDING SITE, designated SEQ ID:32619, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80100] Another function of VGAM2353 is therefore inhibition of QKI (Accession XM_037438). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QKI. RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401) is another VGAM2353 host target gene. RAB3IL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB3IL1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3IL1 BINDING SITE, designated SEQ ID:15063, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80101] Another function of VGAM2353 is therefore inhibition of RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IL1. RAI (Accession NM_006663) is another VGAM2353 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13471, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80102] Another function of VGAM2353 is therefore inhibition of RAI (Accession NM_006663). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RAI. Retinoic Acid Induced 17 (RAI17, Accession XM_166091) is another VGAM2353 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43862, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80103] Another function of VGAM2353 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM_166091). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144) is another VGAM2353 host target gene. RHOBTB1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RHOBTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB1

BINDING SITE, designated SEQ ID:43952, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80104] Another function of VGAM2353 is therefore inhibition of Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB1. SCAM-1 (Accession NM_005775) is another VGAM2353 host target gene. SCAM-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCAM-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAM-1 BINDING SITE, designated SEQ ID:12350, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80105] Another function of VGAM2353 is therefore inhibition of SCAM-1 (Accession NM_005775). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAM-1. Solute Carrier Family 26, Member 10 (SLC26A10, Ac-

cession NM_133489) is another VGAM2353 host target gene. SLC26A10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC26A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A10 BINDING SITE, designated SEQ ID:28560, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80106] Another function of VGAM2353 is therefore inhibition of Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM_133489). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A10. T-box 21 (TBX21, Accession NM_013351) is another VGAM2353 host target gene. TBX21 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBX21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX21 BINDING SITE, designated SEQ ID:14997, to the nucleotide sequence of

VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80107] Another function of VGAM2353 is therefore inhibition of T-box 21 (TBX21, Accession NM_013351). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX21. Testis Expressed Sequence 27 (TEX27, Accession NM_021943) is another VGAM2353 host target gene. TEX27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEX27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEX27 BINDING SITE, designated SEQ ID:22460, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80108] Another function of VGAM2353 is therefore inhibition of Testis Expressed Sequence 27 (TEX27, Accession NM_021943). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX27. Tubby Homolog (mouse) (TUB, Accession NM_003320) is another

VGAM2353 host target gene. TUB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUB BINDING SITE, designated SEQ ID:9324, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80109] Another function of VGAM2353 is therefore inhibition of Tubby Homolog (mouse) (TUB, Accession NM_003320). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUB. WSB1 (Accession NM_134264) is another VGAM2353 host target gene. WSB1 BINDING SITE1 and WSB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WSB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSB1 BINDING SITE1 and WSB1 BINDING SITE2, designated SEQ ID:28617 and SEQ ID:28623 respectively, to the nucleotide sequence of VGAM2353 RNA, herein

designated VGAM RNA, also designated SEQ ID:5064.

[80110] Another function of VGAM2353 is therefore inhibition of WSB1 (Accession NM_134264). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSB1. LOC115073 (Accession XM_055193) is another VGAM2353 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36242, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80111] Another function of VGAM2353 is therefore inhibition of LOC115073 (Accession XM_055193). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC126917 (Accession XM_059091) is another VGAM2353 host target gene. LOC126917 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126917, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE, designated SEQ ID:36871, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80112] Another function of VGAM2353 is therefore inhibition of LOC126917 (Accession XM_059091). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126917. LOC127702 (Accession XM_060619) is another VGAM2353 host target gene. LOC127702 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:37183, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80113] Another function of VGAM2353 is therefore inhibition of LOC127702 (Accession XM_060619). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC127702. LOC144347 (Accession XM_084832) is another VGAM2353 host target gene. LOC144347 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144347 BINDING SITE, designated SEQ ID:37724, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80114] Another function of VGAM2353 is therefore inhibition of LOC144347 (Accession XM_084832). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144347. LOC145438 (Accession XM_096781) is another VGAM2353 host target gene. LOC145438 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145438 BINDING SITE, designated SEQ ID:40537, to

the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80115] Another function of VGAM2353 is therefore inhibition of LOC145438 (Accession XM_096781). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145438. LOC145980 (Accession XM_096914) is another VGAM2353 host target gene. LOC145980 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145980 BINDING SITE, designated SEQ ID:40650, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80116] Another function of VGAM2353 is therefore inhibition of LOC145980 (Accession XM_096914). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145980. LOC146237 (Accession XM_096954) is another VGAM2353 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40669, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80117] Another function of VGAM2353 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC148014 (Accession XM_085999) is another VGAM2353 host target gene. LOC148014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148014 BINDING SITE, designated SEQ ID:38440, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80118] Another function of VGAM2353 is therefore inhibition of LOC148014 (Accession XM_085999). Accordingly, utilities

of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148014. LOC149182 (Accession XM_097605) is another VGAM2353 host target gene. LOC149182 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149182 BINDING SITE, designated SEQ ID:40971, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80119] Another function of VGAM2353 is therefore inhibition of LOC149182 (Accession XM_097605). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149182. LOC150208 (Accession XM_097841) is another VGAM2353 host target gene. LOC150208 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150208 BINDING SITE, designated SEQ ID:41155, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80120] Another function of VGAM2353 is therefore inhibition of LOC150208 (Accession XM_097841). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150208. LOC151278 (Accession XM_087156) is another VGAM2353 host target gene. LOC151278 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151278, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151278 BINDING SITE, designated SEQ ID:39096, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80121] Another function of VGAM2353 is therefore inhibition of LOC151278 (Accession XM_087156). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151278. LOC155064 (Accession XM_088128) is another VGAM2353 host target gene. LOC155064 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC155064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155064 BINDING SITE, designated SEQ ID:39530, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80122] Another function of VGAM2353 is therefore inhibition of LOC155064 (Accession XM_088128). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155064. LOC159199 (Accession XM_089441) is another VGAM2353 host target gene. LOC159199 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:39983, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80123] Another function of VGAM2353 is therefore inhibition of

LOC159199 (Accession XM_089441). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159199. LOC170127 (Accession XM_093116) is another VGAM2353 host target gene. LOC170127 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC170127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170127 BINDING SITE, designated SEQ ID:40176, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80124] Another function of VGAM2353 is therefore inhibition of LOC170127 (Accession XM_093116). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170127. LOC199786 (Accession XM_114021) is another VGAM2353 host target gene. LOC199786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:42620, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80125] Another function of VGAM2353 is therefore inhibition of LOC199786 (Accession XM_114021). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786. LOC200081 (Accession XM_114110) is another VGAM2353 host target gene. LOC200081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200081 BINDING SITE, designated SEQ ID:42705, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80126] Another function of VGAM2353 is therefore inhibition of LOC200081 (Accession XM_114110). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200081. LOC200982 (Accession XM_117305) is an-

other VGAM2353 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43376, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80127] Another function of VGAM2353 is therefore inhibition of LOC200982 (Accession XM_117305). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC201229 (Accession XM_113925) is another VGAM2353 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42543, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80128] Another function of VGAM2353 is therefore inhibition of LOC201229 (Accession XM_113925). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201229. LOC203378 (Accession XM_117541) is another VGAM2353 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43555, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80129] Another function of VGAM2353 is therefore inhibition of LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC219920 (Accession XM_167787) is another VGAM2353 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44809, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80130] Another function of VGAM2353 is therefore inhibition of LOC219920 (Accession XM_167787). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC221399 (Accession XM_168134) is another VGAM2353 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45052, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80131] Another function of VGAM2353 is therefore inhibition of LOC221399 (Accession XM_168134). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221399. LOC221424 (Accession XM_168060) is another VGAM2353 host target gene. LOC221424 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221424 BINDING SITE, designated SEQ ID:44980, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80132] Another function of VGAM2353 is therefore inhibition of LOC221424 (Accession XM_168060). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221424. LOC221794 (Accession XM_168214) is another VGAM2353 host target gene. LOC221794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221794 BINDING SITE, designated SEQ ID:45073, to the nucleotide sequence of VGAM2353 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5064.

[80133] Another function of VGAM2353 is therefore inhibition of LOC221794 (Accession XM_168214). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221794. LOC254351 (Accession XM_170774) is another VGAM2353 host target gene. LOC254351 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254351 BINDING SITE, designated SEQ ID:45542, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80134] Another function of VGAM2353 is therefore inhibition of LOC254351 (Accession XM_170774). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254351. LOC254617 (Accession XM_173236) is another VGAM2353 host target gene. LOC254617 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254617, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254617 BINDING SITE, designated SEQ ID:46519, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80135] Another function of VGAM2353 is therefore inhibition of LOC254617 (Accession XM_173236). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254617. LOC257354 (Accession XM_170810) is another VGAM2353 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45581, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80136] Another function of VGAM2353 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257354. LOC51083 (Accession NM_015973) is another VGAM2353 host target gene. LOC51083 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51083 BINDING SITE, designated SEQ ID:18070, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80137] Another function of VGAM2353 is therefore inhibition of LOC51083 (Accession NM_015973). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51083. LOC92078 (Accession XM_042684) is another VGAM2353 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33744, to the

nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80138] Another function of VGAM2353 is therefore inhibition of LOC92078 (Accession XM_042684). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92078. LOC92661 (Accession XM_046465) is another VGAM2353 host target gene. LOC92661 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:34724, to the nucleotide sequence of VGAM2353 RNA, herein designated VGAM RNA, also designated SEQ ID:5064.

[80139] Another function of VGAM2353 is therefore inhibition of LOC92661 (Accession XM_046465). Accordingly, utilities of VGAM2353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2354 (VGAM2354) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80140] VGAM2354 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2354 was detected is described hereinabove with reference to Figs. 1-8.

[80141] VGAM2354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80142] VGAM2354 gene encodes a VGAM2354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2354 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2354 precursor RNA is designated SEQ ID:2340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2340 is located at position 18623 relative to the genome of Equine Herpesvirus 2.

[80143] VGAM2354 precursor RNA folds onto itself, forming VGAM2354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80144] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2354 folded precursor RNA into VGAM2354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM2354 RNA is designated SEQ ID:5065, and is provided hereinbelow with reference to the sequence listing part.

[80145] VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2354 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2354 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80146] VGAM2354 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2354 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2354 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80147] The complementary binding of VGAM2354 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2354 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2354 host target RNA into VGAM2354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80148] It is appreciated that VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2354 host target genes. The mRNA of each one of this plurality of VGAM2354 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2354 RNA, herein designated VGAM RNA, and which when bound by VGAM2354 RNA causes inhibition of translation of respective one or more VGAM2354 host target proteins.

[80149] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2354 gene, herein designated VGAM GENE, on one or more VGAM2354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80150] It is yet further appreciated that a function of VGAM2354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2354 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2354 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80151] Nucleotide sequences of the VGAM2354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2354 are further described hereinbelow with reference to Table 1.

[80152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2354 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2354 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80153] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2354 gene, herein designated VGAM is inhibition of expression of VGAM2354 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2354 correlate with, and may be deduced from, the identity of the target genes which VGAM2354

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80154] B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707) is a VGAM2354 host target gene. BCL7B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7B BINDING SITE, designated SEQ ID:7433, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80155] A function of VGAM2354 is therefore inhibition of B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707), a gene which is of yet unknown fanction. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7B. The function of BCL7B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.Centrosomal Protein 1 (CEP1, Accession NM_007018) is another VGAM2354 host target gene. CEP1 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by CEP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP1 BINDING SITE, designated SEQ ID:13875, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80156] Another function of VGAM2354 is therefore inhibition of Centrosomal Protein 1 (CEP1, Accession NM_007018), a gene which mediates actin cytoskeleton reorganization at the plasma membrane. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP1. The function of CEP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1295.EH-domain Containing 4 (EHD4, Accession NM_139265) is another VGAM2354 host target gene. EHD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EHD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of EHD4 BINDING SITE, designated SEQ ID:29255, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80157] Another function of VGAM2354 is therefore inhibition of EH-domain Containing 4 (EHD4, Accession NM_139265). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD4. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069) is another VGAM2354 host target gene. GNAI1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI1 BINDING SITE, designated SEQ ID:7838, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80158] Another function of VGAM2354 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069), a gene which is involved as modulators or

transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI1. The function of GNAI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.Histidine Ammonia-lyase (HAL, Accession NM_002108) is another VGAM2354 host target gene. HAL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAL BINDING SITE, designated SEQ ID:7889, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80159] Another function of VGAM2354 is therefore inhibition of Histidine Ammonia-lyase (HAL, Accession NM_002108). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAL. Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM_003949) is another

VGAM2354 host target gene. HAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAP1 BINDING SITE, designated SEQ ID:10073, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80160] Another function of VGAM2354 is therefore inhibition of Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM_003949), a gene which functions as an adaptor protein using coiled coils to mediate interactions among cytoskeletal, vascular, and motor proteins. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAP1. The function of HAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126.MAD, Mothers Against Decapentaplegic Homolog 2 (Drosophila) (MADH2, Accession NM_005901) is another VGAM2354 host target gene. MADH2 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by MADH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH2 BINDING SITE, designated SEQ ID:12521, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80161] Another function of VGAM2354 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 2 (Drosophila) (MADH2, Accession NM_005901). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH2. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM_043865) is another VGAM2354 host target gene. PIK3R1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R1 BINDING SITE, designated SEQ ID:34035, to the nucleotide sequence of VGAM2354 RNA,

herein designated VGAM RNA, also designated SEQ ID:5065.

[80162] Another function of VGAM2354 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM_043865), a gene which acts as an adapter, for the insulin-stimulated increase in glucose uptake and glycogen synthesis. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R1. The function of PIK3R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM826.Regulator of G-protein Signalling 9 (RGS9, Accession NM_003835) is another VGAM2354 host target gene. RGS9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RGS9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS9 BINDING SITE, designated SEQ ID:9927, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80163] Another function of VGAM2354 is therefore inhibition of Regulator of G-protein Signalling 9 (RGS9, Accession NM_003835). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS9. Short Stature Homeobox 2 (SHOX2, Accession NM_006884) is another VGAM2354 host target gene. SHOX2 BINDING SITE1 and SHOX2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SHOX2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOX2 BINDING SITE1 and SHOX2 BINDING SITE2, designated SEQ ID:13747 and SEQ ID:8973 respectively, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80164] Another function of VGAM2354 is therefore inhibition of Short Stature Homeobox 2 (SHOX2, Accession NM_006884), a gene which may be a growth regulator and have a role in specifying neural systems. Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with SHOX2. The function of SHOX2 has been established by previous studies. Homeo box genes encode proteins containing a 60-amino acid residue motif that represents a DNA binding domain. They have been characterized extensively as transcriptional regulators involved in pattern formation in both invertebrate and vertebrate species. Embryonic development is mediated through an interactive network created by the overlapping expression patterns of a number of transcription factors including the homeo box gene superfamily. This dynamic scaffold provides positional information for cell determination and differentiation underlying developmental processes from the simple determination of body axis to the formation of complex body structures. This vital function of homeodomain proteins during embryonic development was initially elucidated in lower organisms. Later, several human genetic disorders were shown to be caused by aberrations in human homeo box genes: Waardenburg syndrome (PAX3; 606597), aniridia (PAX6; 607108), synpolydactyly (HOXD13; 142989), schizencephaly (EMX2; 600035), and Rieger syndrome (PITX2; 601542). SHOX (OMIM Ref. No. 312865) is a pseudoautosomal homeo box gene that is thought to be responsible for idiopathic short stature and

implicated to play a role in the short stature phenotype of Turner syndrome patients. This gene shows high homology to the murine og12 gene, which was consequently proposed as the putative mouse homolog of SHOX. The homeodomains of SHOX (also called PHOG) and og12 were shown to be identical, suggesting that the 2 proteins bind to equivalent DNA elements and therefore trigger similar physiologic pathways. Blaschke et al. (1998) reported the identification of a SHOX-related human gene, which they designated SHOT (for SHOX homologous gene on chromosome 3), that shows a much higher degree of homology to og12 than SHOX. Two different isoforms were isolated, SHOTa and SHOTb, which have identical homeodomains and share a C-terminal 14-amino acid residue motif characteristic for craniofacially expressed homeodomain proteins. The differences between SHOTa and SHOTb reside within the N-termini and an alternatively spliced exon in the C termini. In situ hybridization of og12 on sections from staged mouse embryos detected highly restricted transcripts in the developmental sinus venosus (aorta), female genitalia, diencephalon, mes- and myelencephalon, nasal capsula, palate, eyelid, and limbs. By fluorescence in situ hybridization (FISH), Blaschke et al. (1998)

mapped the human SHOT gene on 3q25-q26. By the same method, De Baere et al. (1998) confirmed the localization of SHOT on 3q25-q26.1. It has been suggested on the basis of chromosomal aberrations that the Cornelia de Lange syndrome (OMIM Ref. No. 122470) maps to 3q26.3. Blaschke et al. (1998) suggested that SHOT is a candidate gene for that disorder. By FISH, Blaschke et al. (1998) mapped the mouse og12 gene to chromosome 3 in a region that shows homology of synteny to human 3q.

[80165] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[80166] Blaschke, R. J.; Monaghan, A. P.; Schiller, S.; Schechinger, B.; Rao, E.; Padilla-Nash, H.; Ried, T.; Rappold, G. A. : SHOT, a SHOX-related homeobox gene, is implicated in craniofacial, brain, heart, and limb development. Proc. Nat. Acad. Sci. 95: 2406-2411, 1998. ; and

[80167] Clement-Jones, M.; Schiller, S.; Rao, E.; Blaschke, R. J.; Zuniga, A.; Zeller, R.; Robson, S. C.; Binder, G.; Glass, I.; Strachan, T.; Lindsay, S.; Rappold, G. A. : The short stature homeo.

[80168] Further studies establishing the function and utilities of SHOX2 are found in John Hopkins OMIM database record

ID 602504, and in sited publications numbered 10624-1062 and 9027 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.ABLIM (Accession NM_002313) is another VGAM2354 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8112 and SEQ ID:13545 respectively, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80169] Another function of VGAM2354 is therefore inhibition of ABLIM (Accession NM_002313). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. AD-020 (Accession XM_002161) is another VGAM2354 host target gene. AD-020 BINDING SITE1 and AD-020 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AD-020, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AD-020 BINDING SITE1 and AD-020 BINDING SITE2, designated SEQ ID:29868 and SEQ ID:17541 respectively, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80170] Another function of VGAM2354 is therefore inhibition of AD-020 (Accession XM_002161). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD-020. DKFZP586M1120 (Accession NM_031294) is another VGAM2354 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25318, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80171] Another function of VGAM2354 is therefore inhibition of DKFZP586M1120 (Accession NM_031294). Accordingly,

utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. FLJ10769 (Accession NM_018210) is another VGAM2354 host target gene. FLJ10769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10769 BINDING SITE, designated SEQ ID:20111, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80172] Another function of VGAM2354 is therefore inhibition of FLJ10769 (Accession NM_018210). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10769. FLJ20015 (Accession NM_018996) is another VGAM2354 host target gene. FLJ20015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20015

BINDING SITE, designated SEQ ID:21069, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80173] Another function of VGAM2354 is therefore inhibition of FLJ20015 (Accession NM_018996). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20015. FLJ20420 (Accession NM_017812) is another VGAM2354 host target gene. FLJ20420 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20420 BINDING SITE, designated SEQ ID:19460, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80174] Another function of VGAM2354 is therefore inhibition of FLJ20420 (Accession NM_017812). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20420. Heart and Neural Crest Derivatives Expressed 1 (HAND1, Accession NM_004821) is another VGAM2354

host target gene. HAND1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAND1 BINDING SITE, designated SEQ ID:11236, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80175] Another function of VGAM2354 is therefore inhibition of Heart and Neural Crest Derivatives Expressed 1 (HAND1, Accession NM_004821). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAND1. KIAA0716 (Accession NM_014705) is another VGAM2354 host target gene. KIAA0716 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0716 BINDING SITE, designated SEQ ID:16245, to the nucleotide sequence of VGAM2354 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5065.

[80176] Another function of VGAM2354 is therefore inhibition of KIAA0716 (Accession NM_014705). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0716. KIAA1095 (Accession XM_041363) is another VGAM2354 host target gene. KIAA1095 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1095 BINDING SITE, designated SEQ ID:33505, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80177] Another function of VGAM2354 is therefore inhibition of KIAA1095 (Accession XM_041363). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1095. KIAA1416 (Accession XM_098762) is another VGAM2354 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1416, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41798, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80178] Another function of VGAM2354 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. KIAA1582 (Accession XM_037262) is another VGAM2354 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32590, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80179] Another function of VGAM2354 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1582. KIAA1841 (Accession XM_087056) is another VGAM2354 host target gene. KIAA1841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1841 BINDING SITE, designated SEQ ID:39024, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80180] Another function of VGAM2354 is therefore inhibition of KIAA1841 (Accession XM_087056). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1841. KIAA1889 (Accession XM_056298) is another VGAM2354 host target gene. KIAA1889 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1889 BINDING SITE, designated SEQ ID:36387, to the

nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80181] Another function of VGAM2354 is therefore inhibition of KIAA1889 (Accession XM_056298). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1889. MGC13183 (Accession NM_032358) is another VGAM2354 host target gene. MGC13183 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13183 BINDING SITE, designated SEQ ID:26144, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80182] Another function of VGAM2354 is therefore inhibition of MGC13183 (Accession NM_032358). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13183. Olfactomedin 3 (OLFM3, Accession XM_088951) is another VGAM2354 host target gene. OLFM3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by OLFM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM3 BINDING SITE, designated SEQ ID:39958, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80183] Another function of VGAM2354 is therefore inhibition of Olfactomedin 3 (OLFM3, Accession XM_088951). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM3. Phosphodiesterase 10A (PDE10A, Accession NM_006661) is another VGAM2354 host target gene. PDE10A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:13460, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80184] Another function of VGAM2354 is therefore inhibition of Phosphodiesterase 10A (PDE10A, Accession NM_006661). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE10A. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM_014644) is another VGAM2354 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:16049, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80185] Another function of VGAM2354 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM_014644). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373) is another

VGAM2354 host target gene. SH3BGRL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BGRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL BINDING SITE, designated SEQ ID:31023, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80186] Another function of VGAM2354 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL. Solute Carrier Family 31 (copper transporters), Member 2 (SLC31A2, Accession XM_011776) is another VGAM2354 host target gene. SLC31A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC31A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC31A2 BINDING SITE, designated SEQ ID:30192, to the nucleotide

sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80187] Another function of VGAM2354 is therefore inhibition of Solute Carrier Family 31 (copper transporters), Member 2 (SLC31A2, Accession XM_011776). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC31A2. Stanniocalcin 2 (STC2, Accession NM_003714) is another VGAM2354 host target gene. STC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STC2 BINDING SITE, designated SEQ ID:9811, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80188] Another function of VGAM2354 is therefore inhibition of Stanniocalcin 2 (STC2, Accession NM_003714). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STC2. TBLR1 (Accession NM_024665) is another VGAM2354 host target gene. TBLR1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by TBLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBLR1 BINDING SITE, designated SEQ ID:23965, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80189] Another function of VGAM2354 is therefore inhibition of TBLR1 (Accession NM_024665). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBLR1. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM2354 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45761, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80190] Another function of VGAM2354 is therefore inhibition of

Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM_053740) is another VGAM2354 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:36115 and SEQ ID:27104 respectively, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80191] Another function of VGAM2354 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM_053740). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. LOC115110 (Accession XM_049825) is another VGAM2354 host target gene. LOC115110 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35504, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80192] Another function of VGAM2354 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC126669 (Accession XM_060121) is another VGAM2354 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37155, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80193] Another function of VGAM2354 is therefore inhibition of

LOC126669 (Accession XM_060121). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC127396 (Accession XM_059139) is another VGAM2354 host target gene. LOC127396 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127396 BINDING SITE, designated SEQ ID:36895, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80194] Another function of VGAM2354 is therefore inhibition of LOC127396 (Accession XM_059139). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127396. LOC147671 (Accession XM_085844) is another VGAM2354 host target gene. LOC147671 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC147671 BINDING SITE, designated SEQ ID:38375, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80195] Another function of VGAM2354 is therefore inhibition of LOC147671 (Accession XM_085844). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147671. LOC150185 (Accession XM_097834) is another VGAM2354 host target gene. LOC150185 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150185 BINDING SITE, designated SEQ ID:41151, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80196] Another function of VGAM2354 is therefore inhibition of LOC150185 (Accession XM_097834). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150185. LOC154739 (Accession XM_098602) is an-

other VGAM2354 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41712, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80197] Another function of VGAM2354 is therefore inhibition of LOC154739 (Accession XM_098602). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC160717 (Accession XM_090457) is another VGAM2354 host target gene. LOC160717 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC160717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160717 BINDING SITE, designated SEQ ID:40009, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80198] Another function of VGAM2354 is therefore inhibition of LOC160717 (Accession XM_090457). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160717. LOC169426 (Accession XM_108739) is another VGAM2354 host target gene. LOC169426 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC169426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169426 BINDING SITE, designated SEQ ID:42206, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80199] Another function of VGAM2354 is therefore inhibition of LOC169426 (Accession XM_108739). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169426. LOC200150 (Accession XM_114131) is another VGAM2354 host target gene. LOC200150 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200150, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200150 BINDING SITE, designated SEQ ID:42712, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80200] Another function of VGAM2354 is therefore inhibition of LOC200150 (Accession XM_114131). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200150. LOC219731 (Accession XM_167596) is another VGAM2354 host target gene. LOC219731 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:44715, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80201] Another function of VGAM2354 is therefore inhibition of LOC219731 (Accession XM_167596). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219731. LOC221069 (Accession XM_167676) is another VGAM2354 host target gene. LOC221069 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221069 BINDING SITE, designated SEQ ID:44767, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80202] Another function of VGAM2354 is therefore inhibition of LOC221069 (Accession XM_167676). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221069. LOC221294 (Accession XM_166297) is another VGAM2354 host target gene. LOC221294 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221294 BINDING SITE, designated SEQ ID:44112, to the nucleotide sequence of VGAM2354 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:5065.

[80203] Another function of VGAM2354 is therefore inhibition of LOC221294 (Accession XM_166297). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221294. LOC221550 (Accession XM_166388) is another VGAM2354 host target gene. LOC221550 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221550 BINDING SITE, designated SEQ ID:44238, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80204] Another function of VGAM2354 is therefore inhibition of LOC221550 (Accession XM_166388). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221550. LOC222008 (Accession XM_168361) is another VGAM2354 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222008, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:45125, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80205] Another function of VGAM2354 is therefore inhibition of LOC222008 (Accession XM_168361). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222008. LOC222256 (Accession XM_168571) is another VGAM2354 host target gene. LOC222256 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222256 BINDING SITE, designated SEQ ID:45247, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80206] Another function of VGAM2354 is therefore inhibition of LOC222256 (Accession XM_168571). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC222256. LOC253263 (Accession XM_173102) is another VGAM2354 host target gene. LOC253263 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253263 BINDING SITE, designated SEQ ID:46359, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80207] Another function of VGAM2354 is therefore inhibition of LOC253263 (Accession XM_173102). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253263. LOC256021 (Accession XM_172884) is another VGAM2354 host target gene. LOC256021 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:46163, to

the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80208] Another function of VGAM2354 is therefore inhibition of LOC256021 (Accession XM_172884). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256021. LOC256118 (Accession XM_174624) is another VGAM2354 host target gene. LOC256118 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256118, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256118 BINDING SITE, designated SEQ ID:46601, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80209] Another function of VGAM2354 is therefore inhibition of LOC256118 (Accession XM_174624). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256118. LOC257495 (Accession XM_175166) is another VGAM2354 host target gene. LOC257495 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC257495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257495 BINDING SITE, designated SEQ ID:46655, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80210] Another function of VGAM2354 is therefore inhibition of LOC257495 (Accession XM_175166). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257495. LOC257576 (Accession XM_175254) is another VGAM2354 host target gene. LOC257576 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257576 BINDING SITE, designated SEQ ID:46715, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80211] Another function of VGAM2354 is therefore inhibition of LOC257576 (Accession XM_175254). Accordingly, utilities

of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257576. LOC92078 (Accession XM_042684) is another VGAM2354 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33740, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80212] Another function of VGAM2354 is therefore inhibition of LOC92078 (Accession XM_042684). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92078. LOC92303 (Accession XM_044108) is another VGAM2354 host target gene. LOC92303 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC92303 BINDING SITE, designated SEQ ID:34133, to the nucleotide sequence of VGAM2354 RNA, herein designated VGAM RNA, also designated SEQ ID:5065.

[80213] Another function of VGAM2354 is therefore inhibition of LOC92303 (Accession XM_044108). Accordingly, utilities of VGAM2354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92303. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2355 (VGAM2355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80214] VGAM2355 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2355 was detected is described hereinabove with reference to Figs. 1-8.

[80215] VGAM2355 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM2355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80216] VGAM2355 gene encodes a VGAM2355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2355 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2355 precursor RNA is designated SEQ ID:2341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2341 is located at position 39033 relative to the genome of Equine Herpesvirus 2.

[80217] VGAM2355 precursor RNA folds onto itself, forming VGAM2355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80218] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2355 folded precursor RNA into VGAM2355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2355 RNA is designated SEQ ID:5066, and is provided hereinbelow with reference to the sequence listing part.

[80219] VGAM2355 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2355 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80220] VGAM2355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2355 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2355 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80221] The complementary binding of VGAM2355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2355 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2355 host target RNA into VGAM2355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80222] It is appreciated that VGAM2355 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2355 host target genes. The mRNA of each one of this plurality of VGAM2355 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2355 RNA, herein designated VGAM RNA, and which when bound by VGAM2355 RNA causes inhibition of translation of respective one or more VGAM2355 host target proteins.

[80223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2355 gene, herein designated VGAM GENE, on one or more VGAM2355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80224] It is yet further appreciated that a function of VGAM2355 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2355 correlate with, and may be deduced from, the identity of the host target genes which VGAM2355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80225] Nucleotide sequences of the VGAM2355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2355 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2355 are further described hereinbelow with reference to Table 1.

[80226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2355 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2355 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80227] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2355 gene, herein designated VGAM is inhibition of expression of VGAM2355 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2355 correlate with, and may be deduced from, the identity of the target genes which VGAM2355 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80228] Bromodomain Adjacent to Zinc Finger Domain, 2B (BAZ2B, Accession NM_013450) is a VGAM2355 host target gene. BAZ2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAZ2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAZ2B BINDING SITE, designated SEQ ID:15124, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80229] A function of VGAM2355 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 2B (BAZ2B, Accession NM_013450). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2B. G Protein-coupled Receptor 85 (GPR85, Accession NM_018970) is another VGAM2355 host target gene. GPR85 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPR85, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR85 BINDING SITE, designated SEQ ID:21042, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80230] Another function of VGAM2355 is therefore inhibition of G Protein-coupled Receptor 85 (GPR85, Accession NM_018970). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR85. Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is another VGAM2355 host target gene.

NTRK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:12845, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80231] Another function of VGAM2355 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM_003347) is another VGAM2355 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9360, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80232] Another function of VGAM2355 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215.DKFZP761G1913 (Accession NM_031474) is another VGAM2355 host target gene. DKFZP761G1913 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761G1913, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP761G1913 BINDING SITE, designated SEQ ID:25545, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80233] Another function of VGAM2355 is therefore inhibition of DKFZP761G1913 (Accession NM_031474). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761G1913. Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969) is another VGAM2355 host target gene. EIF5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5 BINDING SITE, designated SEQ ID:7698, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80234] Another function of VGAM2355 is therefore inhibition of Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with EIF5. FLJ12586 (Accession NM_024620) is another VGAM2355 host target gene. FLJ12586 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12586 BINDING SITE, designated SEQ ID:23881, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80235] Another function of VGAM2355 is therefore inhibition of FLJ12586 (Accession NM_024620). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12586. FLJ14494 (Accession XM_165571) is another VGAM2355 host target gene. FLJ14494 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14494 BINDING SITE, designated SEQ ID:43693, to the nucleotide

sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80236] Another function of VGAM2355 is therefore inhibition of FLJ14494 (Accession XM_165571). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14494. HSPC031 (Accession NM_016101) is another VGAM2355 host target gene. HSPC031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPC031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC031 BINDING SITE, designated SEQ ID:18184, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80237] Another function of VGAM2355 is therefore inhibition of HSPC031 (Accession NM_016101). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC031. KIAA1423 (Accession XM_029703) is another VGAM2355 host target gene. KIAA1423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:30919, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80238] Another function of VGAM2355 is therefore inhibition of KIAA1423 (Accession XM_029703). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1423. P21 (CDKN1A)-activated Kinase 2 (PAK2, Accession XM_039354) is another VGAM2355 host target gene. PAK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PAK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK2 BINDING SITE, designated SEQ ID:33062, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80239] Another function of VGAM2355 is therefore inhibition of P21 (CDKN1A)-activated Kinase 2 (PAK2, Accession

XM_039354). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK2. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_003559) is another VGAM2355 host target gene. PIP5K2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:9606, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80240] Another function of VGAM2355 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_003559). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B. LOC134265 (Accession XM_059702) is another VGAM2355 host target gene. LOC134265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC134265, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134265 BINDING SITE, designated SEQ ID:37075, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80241] Another function of VGAM2355 is therefore inhibition of LOC134265 (Accession XM_059702). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134265. LOC144438 (Accession XM_084860) is another VGAM2355 host target gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37740, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80242] Another function of VGAM2355 is therefore inhibition of LOC144438 (Accession XM_084860). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC144438. LOC147071 (Accession XM_054031) is another VGAM2355 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:36133, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80243] Another function of VGAM2355 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC201173 (Accession XM_113312) is another VGAM2355 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:42212, to

the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80244] Another function of VGAM2355 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC51706 (Accession XM_046746) is another VGAM2355 host target gene. LOC51706 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51706 BINDING SITE, designated SEQ ID:34816, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80245] Another function of VGAM2355 is therefore inhibition of LOC51706 (Accession XM_046746). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51706. LOC91291 (Accession XM_037478) is another VGAM2355 host target gene. LOC91291 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC91291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91291 BINDING SITE, designated SEQ ID:32629, to the nucleotide sequence of VGAM2355 RNA, herein designated VGAM RNA, also designated SEQ ID:5066.

[80246] Another function of VGAM2355 is therefore inhibition of LOC91291 (Accession XM_037478). Accordingly, utilities of VGAM2355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91291. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2356 (VGAM2356) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[80247] VGAM2356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2356 was detected is described hereinabove with reference to Figs. 1-8.

[80248] VGAM2356 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine Herpesvirus 2. VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[80249] VGAM2356 gene encodes a VGAM2356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2356 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2356 precursor RNA is designated SEQ ID:2342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2342 is located at position 38873 relative to the genome of Equine Herpesvirus 2.

[80250] VGAM2356 precursor RNA folds onto itself, forming VGAM2356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[80251] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2356 folded precursor RNA into VGAM2356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2356 RNA is designated SEQ ID:5067, and is provided hereinbelow with reference to the sequence listing part.

[80252] VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2356 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[80253] VGAM2356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2356 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[80254] The complementary binding of VGAM2356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2356

host target RNA into VGAM2356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[80255] It is appreciated that VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2356 host target genes. The mRNA of each one of this plurality of VGAM2356 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2356 RNA, herein designated VGAM RNA, and which when bound by VGAM2356 RNA causes inhibition of translation of respective one or more VGAM2356 host target proteins.

[80256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2356 gene, herein designated VGAM GENE, on one or more VGAM2356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[80257] It is yet further appreciated that a function of VGAM2356 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2356 correlate with, and may be deduced from, the identity of the host target genes which VGAM2356 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[80258] Nucleotide sequences of the VGAM2356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2356 are further

described hereinbelow with reference to Table 1.

[80259] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2356 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[80260] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2356 gene, herein designated VGAM is inhibition of expression of VGAM2356 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2356 correlate with, and may be deduced from, the identity of the target genes which VGAM2356 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[80261] Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004013) is a VGAM2356 host target gene. DMD BINDING SITE1 through DMD BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE3, designated SEQ ID:10196, SEQ ID:10223 and SEQ ID:10235 respectively, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80262] A function of VGAM2356 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004013), a gene which muscular dystrophy . Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM_033508) is another VGAM2356 host target gene. GCK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCK BINDING SITE, designated SEQ ID:27285, to the nucleotide se-

quence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80263] Another function of VGAM2356 is therefore inhibition of Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM_033508), a gene which catalyzes the initial step in utilization of glucose by the beta-cell and liver at physiological glucose concentration. Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCK. The function of GCK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1781.Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411) is another VGAM2356 host target gene. HLCS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HLCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:5992, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM

RNA, also designated SEQ ID:5067.

[80264] Another function of VGAM2356 is therefore inhibition of Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411). Accordingly, utilities of VGAM2356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS. Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM_170949) is another VGAM2356 host target gene. INPP5B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INPP5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5B BINDING SITE, designated SEQ ID:45736, to the nucleotide sequence of VGAM2356 RNA, herein designated VGAM RNA, also designated SEQ ID:5067.

[80265] Another function of VGAM2356 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM_170949), a gene which hydrolyzes the calcium-mobilizing second messenger ins(1,4,5)p3. Accordingly, utilities of VGAM2356 include diagnosis, prevention
